METHODS FOR LINKING ITEM PARAMETERS Final Report
C. David Vale, Vincent A. Maurelli, Kathleen A. Gialluca, David J. Weiss, and Malcolm James Ree Brooks AFB, Tex. AFHRL Aug. 1981 190 p refs
(Contract F33615-80-C-0008)
(AD-A105509; AFHRL-TR-81-10) Avail: NTIS HC A09/MF A01 CSCL 05/9

A simulation study to determine appropriate linking methods for adaptive testing items was designed. Responses of examinees of three group sizes for four test lengths were simulated. Three basic data sets were created: (a) randomly sampled data set, (b) systematically sampled data set, and (c) selected data set. Three categories of evaluative criteria were used: fidelity of parameter estimation, asymptotic ability estimates, root-mean-square error of estimates, and the correlation between true and estimated ability. Test length appeared to be relatively more important to calibration effectiveness than was sample size. efficiency analyses suggested that increases in test length were at least three to four times as effective in improving calibration efficiency as proportionate increases in calibration sample sizes. The asymptotic ability analyses suggested that the linking procedures based on Bayesian ability estimation (an equivalent-groups procedure) were somewhat more effective than the others and that the equivalent-tests method was typically no better than not linking at all. Analyses using the relative efficiency criteria suggested that the equivalent-groups procedures were superior to the equivalent-tests procedures and that those using Bayesian scoring procedures were slightly superior to the others tested. Efficiency loss due to linking error was always less than that due to item calibration error and although test length and sample size had a definite effect on calibration efficiency, no strong effects appear with respect to linking efficiency. For the systematically sampled data set, the anchor-test and anchor-group methods were considered along with the equivalence methods.

PREPROTOTYPE NITROGEN SUPPLY SUBSYSTEM DEVELOPMENT Interim Report, Jun. 1981
D. B. Heppner, T. M. Hallick, and F. H. Schubert Jun. 1981 50 p refs
(Contract NAS2-10673)
(NASA-CR-166192; LSI-TR-410-4) Avail: NTIS HC A03/MF A01 CSCL 06K

A nitrogen supply subsystem based on the dissociation of hydrazine into a mixture of hydrogen and nitrogen is developed. The latter is separated to provide makeup nitrogen to control the composition of spacecraft atmospheres. Specific hardware developments resulted in the design and fabrication of a nominal 3.6 kg/d nitrogen generation module. The design integrates a hydrazine catalytic dissociator, three ammonia dissociation stages and four hydrogen separation stages into a 33 kg, 14 cu dm module. A technique was devised to alternate the ammonia dissociation and hydrogen separation stages to give high nitrogen purity in the end product stream. Tests show the product stream to contain less than 0.5 percent hydrogen and 10 parts per million ammonia. The design and development of a test stand for the nitrogen generation module and a series of tests which verified its operation and performance capability are described.

HUMANIZATION OF WORKING PLACES IN THE FOUNDRY BY USE OF AN AUTOMATIC FETTLING EQUIPMENT Final Report
Hanns Helge Bolle Bonn Bundesministerium fuer Forschung und Technologie Feb. 1981 64 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-HA-81-004; ISSN-0171-7618) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 13,40

Operation of a pilot plant using an industrial robot in the fettling shop of a foundry is described. A continuous path 5 axis robot was employed to steer the pneumatic grinding equipment while the castings remained in a fixed position. Satisfactory removal of edges from the castings was achieved. Ergonomic analysis revealed a reduction of stress for human workers in the foundry. Problems encountered require an automatic change of tools and investigation of the wear of abrasives. J.D.H.

A CRITERION FOR THE DISPOSAL OF M58 SLEEPING BAGS
W. A. Lotens and E. J. M. Smienk 1979 23 p refs In DUTCH; ENGLISH summary
(Contract A77/KL/156)
(IZF-1979-15; TDCK-73398) Avail: NTIS HC A02/MF A01

In order to separate sufficiently insulating from non-sufficiently insulating sleeping bags, a convenient criterion was developed. Physical measurements showed that the thickness of the material under a pressure of 15 N/sq m gives a good correlation with insulating power. By means of a heat conduction model of a man in a bag (based on experiments with subjects) a relation between minimum tolerable outside temperature and thickness of the bag was established. It turns out that with optimal use of all personal equipment a new sleeping bag (26 mm thickness) will fail to keep a man warm in 3% of the man-nights and an old one (12 mm thickness) in 6%. It is recommended to dispose of bags with a thickness less than 20 mm. This result, however, is highly dependent on the insulative suit that is worn. M.G.

HEARING PROTECTION
G. F. Smoorenburg, A. M. Mimpen, and H. A. vanLeeuwen 1980 17 p refs In DUTCH; ENGLISH summary
(Contract A76/K/104)
(IZF-1980-2; TDCK-73415) Avail: NTIS HC A02/MF A01

The acoustic attenuation of 20 types of ear plugs and 20 types of ear muffs was surveyed. Important design aspects, the maximum attenuation possible closing the ear canal, the attenuation of plug plus muff, and measuring methods are discussed. To determine the attenuation for practical purposes, differences in hearing protector fitting, temporary removal of protectors, and the noise spectrum must be considered. The effect of wearing hearing protectors on speech intelligibility is discussed. Speech intelligibility does not decrease for people with normal hearing exposed to steady state noise but it may decrease in relatively silent periods of fluctuating or intermittant noise and for all noises if one has a perceptive hearing loss. EVALUATION OF CHEMICAL PROTECTIVE FACELETS AND COMPARISON OF FOUR PROTOTPYES
W. A. Lotens 1980 21 p In DUTCH; ENGLISH summary
(Contract A79/KL/111)
(IZF-1980-15; TDCK-75013) Avail: NTIS HC A02/MF A01

In a controlled field experiment four prototypes of chemical protective facelets were tested to determine the effect on physical and mental performance, and the chemical protection and ergonomic properties. Wearing facelets decreases the physical performance on running 400 m resp. 3 km by 3.5 resp. 7.5 percent. When worn during 24 hr. physical performace is variable and mental performance decreases by ca. 10 percent. There is no indication for adaptation within a one-week period. Chemical protection is sufficient for all four types after a while of wearing, however, one of four is highly sensitive for rain. Ergonomic tests show only slight differences between the facelets but there is a marked difference in comfort. Because of this the subjects preferred two types above the other two. Protection during sleep is far from optimal. Author

THE LINK-MILES DRIVER TRAINING SIMULATOR FOR TRACKED VEHICLES: INFLUENCE OF CABIN MOTION ON GEAR-CHANGE LEARNING
K. J. Poll 1980 15 p refs In DUTCH; ENGLISH summary
(Contract A76/KL/148)
(IZF-1980-24; TDCK-75017) Avail: NTIS HC A02/MF A01

The influence of the moving base from the Leopard driving simulator on gear-change learning was studied. Twelve trainees were trained with motion and twelve others without motion. All trainees were constantly accompanied by the instructor and after the training on the simulator, all trained on the tank. No differences between both groups were found in learning time on the simulator and in learning time on the tank. This means that the information, given by the motion, can be replaced by good instruction. Author

SIMULATOR DATA ON HUMAN ERROR PROBABILITIES
E. J. Kozinsky (General Physics Corp.) and H. E. Guttmann 1981 7 p refs Presented at the ANS/ENS Topical Meeting on Probabilistic Risk Assessment, Port Chester, N.Y., 20 Sep. 1981
(Contract DE-AC04-76DP-00789)
(DE81-026094; SAND-81-1707C; CONF-810905-4) Avail: NTIS HC A02/MF A01

Analysis of operator errors on NPP simulators was used to determine human error probabilities (HEP). Simulator data tapes are analyzed for operator error rates. The tapes collected, using performance measurement system software, contain a history of all operator manipulations during simulated casualties. Analysis yields a time history or operational sequence diagram and a manipulation summary, both stored in computer data files. Data searches yield information on operator errors of omission and commission. This work experimentally determined HEP's for probabilistic risk assessment calculations. DOE

USE OF A TELEVISION MULTIPOINT x-y TRACKER FOR DETERMINING THE TRANSMISSION OF VIBRATIONS ON HUMAN BEINGS [UEBER DIE ANWENDUNG EINES 'TV-MULTIPOINT x-y TRACKERS' ZUR BESTIMMUNG DER SCHWINGUNGSUEBERTRAGUNG AUF DEN MENSCHEN]
L. Vogt and E. Schwartz 1980 10 p In GERMAN
Avail: NTIS HC A02/MF A01

A television multipoint x-y tracker was used to study the influence of mechanical vibrations on the human body, in a project on human factors in man machine systems. A mechanical model of a human being seated on a shaker was employed on which the mechanical impedance and the vibration transmission (transmissibility) were investigated as a function of vibration frequency. The multipoint x-y tracker provides contactless registration of the motions of the head. The system is based on a television camera, and allows the simultaneous and continuous registration of the x and y coordinates of three points of a moving object. Author (ESA)

EVALUATION OF AIR CLEANING AND MONITORING EQUIPMENT USED IN RECIRCULATION SYSTEMS
Mark L. Holcomb and Robert C. Scholz Apr. 1981 200 p refs
(Contract PHS-NIOSH-210-78-0011)
(PB81-242695; DHHS/PUB/NIOSH-81-113) Avail: NTIS HC A01; SOD HC CSCL 06J

Several pilot scale air cleaners and monitors were evaluated to determine their performance characteristics, maintenance requirements, and reliability for use in a recirculating exhaust system. A set of evaluation criteria for recirculation system components were developed. Then, selected system components (including an electrostatically augmented fabric filter, electrostatic precipitator, aspirated cartridge filter, four different extractive type particulate air monitors, three different extractive ozone monitors and a safety monitoring filter were installed and tested on a welding process exhaust. The results indicate that many factors must be evaluated before a decision can be reached concerning the use of a particular device. Additionally, components of a complete recirculation monitoring system were identified and the need for the development of commercial devices incorporating all of these components was evidenced by the fact that each of the commercially available devices tested lacked one or more of these components. AN EVALUATION OF ENGINEERING CONTROL TECHNOLOGY FOR SPRAY PAINTING
Dennis M. OBrien and Donald E. Hurley Jun. 1981 185 p refs
(PB81-243123; DHHS/PUB/NIOSH-81-121) Avail: NTIS

MF A01: HC SOD CSCL 06J

Field surveys of 11 finishing operations provided information for an evaluation of control technology for spray painting and coating processes. Studies were conducted in the automobile refinishing, wood and metal furniture, transportation equipment (nonautomotive), heavy machinery, and appliance finishing industries. Processes selected provide representative coverage of spray finishing operations relative to the number of exposed workers, different control techniques, physical size of the workpiece, and the coating systems that are typically used. Control of selected health hazards is discussed; available control options evaluated. Case study summaries include analysis of: hazards, engineering controls and work practices, ventilation measurements, air sampling data and personal protective equipment. Results should be usable as a reference source. GRA

COMPUTING TIME MEASUREMENTS ON THE FFM MULTICOMPUTER SYSTEM [RECHENZEITMESSUNGEN AM FFM-MULTICOMPERSYSTEM]

G. Neumann, R. Ackermann, and W. Gruenwald Oct. 1980 49 p refs In GERMAN
(FFM-300) Copyright. Avail: Issuing Activity

The computing performance at which the multiminicomputer is capable of delivering was investigated in relation to the operational system price payed for the gain in parallelism. This gain depends on utilization and configuration of the computer network. A software controllable measuring module was developed for measuring computing times. Bus storage behavior of a multiprocessor node of the network and the most important communication tasks of the unloaded system were investigated. A pipeline of tasks, as an example of utilization, was applied. Simultaneously, the influence of high communication rate and high degree of parallel work was studied. These pipeline measurements were compared with the time required for the same task by a single processor. Results show a need for improvement of the system. Author (ESA)

It was the goal of this development project to extend development know how in order to close the gap to the microprocessor market leaders in the USA. In the field of single-chip-microcomputers the development of our nanocomputer was finished successfully. Also the development of two application-oriented single-chip-microcomputers for use in entertainment electronic systems was completed. The CPU 8085, a standard 8 bit microcomputer was developed with license and volume production was started. Beyond that peripheral components, for instance a multifunction asynchronous receiver-transmitter-chip were developed. With respect to the 16 bit microprocessors, the CPU 2016 was developed with success. During the development of the CPU 3016C the original goals with respect to system concept were reached completely and partly with respect to system development. This task will be continued in a following project. Author

The SIPMOS (Siemens Power MOS) technology was developed for the fabrication of power MOS transistors. SIPMOS transistors with reverse voltages between 50 and 1000 V were assessed and experimentally tested. The feasibility of a MOS driven thyristor and an optically driven triac was demonstrated. Since they are capable of operating on an input voltage as low as 5 V, all the developed SIPMOS devices are directly compatible with microcomputers and LSI circuits. T.M.

DEVELOPMENT ON A NEW KIND OF MICROPROCESSOR-BASED LOCK Final Report, Nov. 1980

Peter Leicher, Christian Kreppel, and Fritz Mueller Bonn Bundesministerium fuer Forschung und Technologie Aug. 1981 26 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-128; ISSN-0340-7608) Avail: NTIS HC A03/MF A01

In common unlocking a lock is caused on the knowledge of two coincident informations. Here the lock is built up electronically and the information to be compared is stored in electrically alterable read only memories, of which one is located in the lock and in the key. The information belonging together is altered with every locking cycle. One pair of storage cells is reserved for every lock-key combination. Further, a programming key will be detected, capable of programming and deprogramming the lock function for a key. This aim was reached by building up a single-chip microprocessor based circuit with interface circuits to the electrically alterable read only memories, the random generator and the sequence control units in lock and key. New lines on usage and possibilities on building up and assembling locking systems are given with these kind of locks. So unlocking a car, private building, factory door etc. would be possible without preplanning and replacing locks. Author

EDITEX: A TELEX TEXT-EDITOR BASED ON AN 8085 MICROPROCESSOR

N. W. Kaan, P. Feenstra, W. J. M. Geerdink, and N. A. Noz Feb. 1980 29 p refs In DUTCH; ENGLISH summary
(PHL-1980-06; TDCK-73837) Avail: NTIS HC A03/MF A01

A microprocessor-based text editor specially developed to add text editing capabilities to currently used telex machines without any necessary technical changes is described. An overview is given of the hardware and software which were developed to realize the text editor. The User Manual is included. Author

DEVELOPMENT OF AN X.25 PROTOCOL CONVERTER Final Report

Christopher Chlap and Hans Peter Dittler Bonn Bundesministerium fuer Forschung und Technologie Aug. 1981 256 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-DV-81-002; ISSN-0170-1911) Avail: NTIS HC A12/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 42,10

The objective of the project was the development of a cheap X.25-adaption box with universal applicability and good changeability, so that it can easily be adapted to different interface requirements, where especially BASIC MODE protocols were assumed on the primary side. The requirement of low costs was fulfilled by using a common microprocessor type (INTEL 8080). The developed software consists of the modules of the operating system, the X.25 packet level, th X.25 frame level, and of the primary protocol, where the latter can easily be exchanged. The project proved that complex data communication protocols can be implemented on microprocessors, showing a good efficiency. The box supports on the primary side a great variety of single and multidrop lines. T.M.

IMPLEMENTATION AND APPLICATION OF A SET THEORETICAL DATA BASE SYSTEM Final Report
Anton Braig, Siegmar Gweissner, Renate Mandrella, Ursula Matheis, and Juergen Welter Bonn Bundesministerium fuer Forschung und Technologie Sep. 1981 194 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-DV-81-004; ISSN-0170-9011) Avail: NTIS HC A09/MF A01

The particular system or model-oriented concepts for data declaration and manipulation restrict the ways in which information can be handled within the currently available conventional and relational-oriented data base systems. A vital extension of a data base systems performance range can be achieved by applying mathematical methods for the implementation of complex logical models for information handling. This was demonstrated by an experimental modular implementation of the essential functions of a data base system applied to a data base problem in the area of document retrieval. An example of automatic handling of descriptor relations of any kind is given by using the hierarchical relations of a technical thesaurus for a suitable variation of the retrieval area. T.M.

ELECTRONIC PICTURE BASE Final Report
Hans-Dieter Boehring, Hubertus Busch, Jens Christiansen, Jacobus Coumans, Ruediger Grewer, Hans-Dieter Hinz, Herbert Loebl, Dietrich Meyer-Ebrecht, Rainer Pape, Ulf Rothgordt et al Bonn Bundesministerium fuer Forschung und Technologie Sep. 1981 192 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-DV-81-005; ISSN-0170-9011) Avail: NTIS HC A09/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 35,70

The electronic processing and filing of large quantities of pictures was studied. An approach to the architecture of decentralized picture-processing/picture-base systems is described. The signal processing tasks, control tasks, and management task are to be performed in separated system levels. For the signal level a concept was developed for a fast and flexible picture processor, and methods for the implementation of picture operation, in particular picture coding processes, were elaborated. A state-of-technology review of peripheral devices was performed. Extensive investigations were carried out concerning electrostatic grey-tone printing. Promising results were achieved with the electrophoretic process and an experimental system was assembled to study architectural problems as well as to test peripheral devices. T.M.

DEPTH/BREADTH TRADOFF IN HIERARCHICAL COMPUTER MENUS
Dwight P. Miller 1981 13 p refs Presented at the Human Factors Soc. Meeting, Rochester, N.Y., 12 Oct. 1981
(Contract DE-AC04-76DP-00789)
(DE81-028392; SAND-81-1860C; CONF-81132-1) Avail: NTIS HC A02/MF A01

Goal acquisition speed and accuracy were compared for subjects using four different menu configurations of a semantic hierarchy on an interactive computer terminal. Depth (the number of menu levels) varied from one to six, while breadth (the number of choices per menu) varied from two to 64. Goal acquisition time for the four experimental groups produced a U shaped function with a minimum at the configuration of two levels with eight choices per level. Error data corroborated the acquisition times demonstrating that the fastest conditions also produced the least errors. Optimization of the depth/breadth tradeoff is an important design consideration in goal acquisition tasks requiring speed and accuracy. DOE

THE ARCHITECTURE OF SIRENE: A DISTRIBUTED COMPUTER SYSTEM FOR TEACHING [ARCHITECTURE DE SIRENE: UN SYSTEME D'INFORMATIQUE REPARTIE POUR L'ENSEIGNEMENT]
Jean-Alain Hernandez, Eric Horlait, and Guy Pujolle Jul. 1981 16 p refs In FRENCH Presented at Cong. AFCET-TTI, Nov. 1981
(ENST-C-81004; TTI-6) Avail: NTIS HC A02/MF A01

A system composed of heterogeneous equipment, e.g., graphics consoles and Videotex terminals, linked through a local network is described. Calculation workload is distributed among microcomputers (type Apple 2) and minicomputers. The user can address one (or several) of the communal resources of the system from any terminal. The equipment intercommunication protocols are characterized. The dependence of network efficiency on these protocols is stressed. A layered hierarchy is used and programming language problems are discussed. Author (ESA)

DESCRIPTION AND COMPARISON OF ALGORITHMS FOR SOLVING LARGE SETS OF SPARSE MATRIX NORMAL EQUATIONS IN GEODESY AND PHOTOGRAMMETRY Ph.D. Thesis - Technischen Univ., Munich [DARSTELLUNG UND VERGLEICHE VON LOESUNGSSTRATEGIEN FUER GROSSE SCHWACH BESETZTE NORMALGLEICHUNGSSYSTEME IN DER GEODAESIE UND IN DER PHOTOGRAMMETRIE]

Franz Steidler Verlag der Bayerischen Akademie der Wissenschaften 1980 117 p refs In GERMAN
(Ser-C-261; ISSN-0065-5325; ISBN-3-7696-9313-2) Avail: Issuing Activity

Algorithms were investigated in relation to calculation time and data storage capability. For geodetic networks, direct techniques for sparse matrices are very well suited. For photogrammetric bundle-block adjustments with self calibration the conventional use of band algorithms is the best choice. For generating a digital terrain model following the finite element method, the band algorithm solves the normal equations in the fastest way. Author (ESA)

INTEGRATED TESTING AND VERIFICATION SYSTEM FOR RESEARCH FLIGHT SOFTWARE DESIGN DOCUMENT Contractor Report

Richard N. Taylor, Randall L. Merilatt, and Leon J. Osterweil Hampton, Va. NASA 31 Jul. 1979 243 p refs
(Contract NAS1-15253)
(NASA-CR-159095) Avail: NTIS HC A11/MF A01 CSCL 09B

The NASA Langley Research Center is developing the MUST (Multipurpose User-oriented Software Technology) program to cut the cost of producing research flight software through a system of software support tools. The HAL/S language is the primary subject of the design. Boeing Computer Services Company (BCS) has designed an integrated verification and testing capability as part of MUST. Documentation, verification and test options are provided with special attention on real time, multiprocessing issues. The needs of the entire software production cycle have been considered, with effective management and reduced lifecycle costs as foremost goals. Capabilities have been included in the design for static detection of data flow anomalies involving communicating concurrent processes. Some types of ill formed process synchronization and deadlock also are detected statically. M.D.K.

FUNCTIONAL DESCRIPTION OF THE ISIS SYSTEM

W. Joseph Berman Oct. 1979 28 p
(Contract NAS1-14862)

(NASA-CR-159152) Avail: NTIS HC A03/MF A01 CSCL 09B

Development of software for avionic and aerospace applications (flight software) is influenced by a unique combination of factors which includes: (1) length of the life cycle of each project. (2) necessity for cooperation between the aerospace industry and NASA; (3) the need for flight software that is highly reliable: (4) the increasing complexity and size of flight software; and (5) the high quality of the programmers and the tightening of project budgets. The interactive software invocation system (ISIS) which is described is designed to overcome the problems created by this combination of factors. M.D.K.

COMPUTER PROGRAM FOR COMPUTING AND PLOTTING BODE, PHASE, AND NYQUIST DIAGRAMS AND TIME RESPONSES OF GIVEN FREQUENCY TRANSFER FUNCTIONS [COMPUTERPRORAMMA VOOR HET BEREKENEN EN PLOTTEN VAN BOE-, FASE EN NYQUIST-DIGRAMMEN VAN TIJDRESPONSIES VAN GEGEVEN FREKWENTIE-OVERDRACHTSFNKTIES]

S. J. Vitterdijk 31 Oct. 1979 76 p In DUTCH; ENGLISH summary

(LEOK-TR-1979-13; TDCK-73396) Avail: NTIS HC A05/MF A01

The background and use of a computer program that calculates and plots the Bode-, phase- and Nyquist-diagram of a given frequency response function of arbitrary order are described. The frequency response function is allowed to be of a direct type function, for example in case of analyzing a filter, or of a feed forward together with a feedback type function, in case of analyzing a control system. The program offers also the possibility of calculating and plotting the time response function, related to a frequency response function, as a result of one of the several possible input signals as function of time. ANALYSIS OF HEURISTICS FOR STOCHASTIC PROGRAMMING: RESULTS FOR HIERARCHICAL SCHEDULING PROBLEMS

M. A. H. Dempster (Oxford Univ.), M. L. Fisher (Pennsylvania Univ.), L. Jansen (Algemene Bank Nederland), B. J. Lageweg, J. K. Lenstra, and A. H. G. Rinnooykan (Erasmus Univ.) Jun. 1981 26 p refs Submitted for publication

(Grants NSF ENG-78-26500; NATO-9.2.02(SRG); NATO-1575)

(MC-BUT-142/81) Avail: NTIS HC A03/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

Certain multi-stage decision problems that arise frequently in operations management planning and control allow a natural formulation as multi-stage stochastic programs. In job shop scheduling, for example, the first stage could correspond to the acquisition of resources subject to probabilistic information about the jobs to be processed, and the second stage to the actual allocation of the resources to the jobs given deterministic information about their processing requirements. For two simple versions of this hierarchical scheduling problem, heuristic solution methods are described and their performance is shown asymptotically optimal both in expectation and in probability. COMPARISON OF COMPUTER CODES (CE-THERM, FRAP-T5, GT3-FLECHT, AND TRUMP-FLECHT) WITH DATA FROM THE NRU-LOCA THERMAL HYDRAULIC TESTS

C. L. Mohr, W. N. Rausch, and G. M. Hesson Jul. 1981 8 p refs Presented at the 6th Intern. Conf. on Structural Mech. in Reactor Technol., Paris, 17 Aug. 1981

(Contract DE-AC06-76RL-01830)

(DE81-028136; PNL-SA-9328; CONF-810801-56) Avail: NTIS HC A02/MF A01

The LOCA Simulation Program in the NRU reactor is the first set of experiments to provide data on the behavior of full-length, nuclear-heated PWR fuel bundles during the heatup, reflood, and quench phases of a loss-of-coolant accident (LOCA). This paper compares the temperature time histories of 4 experimental test cases with 4 computer codes: CE-THERM, FRAP-T5, GT3-FLECHT, and TRUMP-FLECHT. The preliminary comparisons between prediction and experiment show that the state-of-the art fuel codes have large uncertainties and are not necessarily conservative in predicting peak temperatures, turn around times, and bundle quench times. DESCRIPTION OF AN EXACT RECURSIVE METHOD TO SIMPLIFY SHADING CALCULATIONS

A. D. Nawrocki and Ronald Kammerud Apr. 1981 11 p refs Presented at the ASME Solar Energy Div., 3rd Ann. Systems Simulation and Econ. Anal./Heating and Cooling Operational Results Conf., Reno, Nev., 27 Apr. - 1 May 1981

(Contract W-7405-eng-48)

(DE81-027409; LBL-11390; CONF-810405-16) Avail: NTIS HC A02/MF A01

A method called SHADE for simplifying shading calculations as performed by a programmable calculator or microcomputer is described. Preliminary applications of SHADE using a Hewlett Packard HP-41C programmable calculation are outlined. For a given solar hour, SHADE is used to compute the following quantities: the percentage of the total area of the opening which is shaded; the shaded area itself; the cosine of the angle of incidence between Sun and glazing surface; the direct insolation at this surface, with and without shading; and the direct solar power at this surface, with and without shading. In its application, SHADE can be used in preliminary design and comparative analyses of shading devices on an hourly, daily, or seasonal basis, provided that the fins and overhangs are square or rectangular and lie in planes perpendicular to the plane of the opening, and that the opening itself is vertical and rectangular with arbitrary building azimuths. Design candidates include conventional overhangs and side fins, porches, and reveals. In principle, SHADE can be extended to awnings, slatted sun screens, and bevelled recesses and to calculations of direct solar gain through vertical and non-vertical glazings. DOE

ON THE REGULARITY OF THE PRINCIPLE VALUE OF THE DOUBLE LAYER POTENTIAL

H. Schippers Apr. 1981 26 p refs Submitted for publication

(MC-NW-104/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3,15

The regularity of the principal value of the potential due to a doublet distribution mu along the boundary S of a two-dimensional (2-D) open connected set is discussed. Assuming S to be a Lyapunov boundary and mu to be bounded and integrable it is proved that the principal value in 2-D is more regular than the one in 3-D. This result is applied to the aerodynamic problem of calculation of potential flows around 2-D bodies. M.G.

ON THE CHOICE OF SUITABLE OPERATORS AND PARAMETERS IN MULTIGRID METHODS
W. J. A. Mol Jun. 1981 52 p refs
(MC-NW-107/81) Avail: NTIS HC A04/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 6.30

Multigrid methods for the solution of elliptic boundary value problems are discussed. These methods are described by a simple Algol-like program. By special choices of some operators and parameters, almost every multigrid strategy proposed in the literature for linear problems can be recovered. Several possibilities for the restriction, prolongation, coarse grid, and smoothing operators are considered. Furthermore, the number of smoothing steps and the number of coarse grid corrections are discussed. Some comparitive experiments are described with the Poisson, anisotropic diffusion, and the convection-diffusion equations. M.G.

THERMAL CONVECTION SIMULATION IN THREE DIMENSIONS BY A MODIFIED FINITE ELEMENT METHOD
C. D. Upson, P. M. Gresho, R. L. Sani, S. T. Chan, and R. L. Lee 21 Jul. 1981 24 p refs Presented at the 2nd Intern. Symp. on Numerical Methods and Heat Transfer, College Park, Md., 28-30 Sep. 1981
(DE81-028847; UCRL-85555; CONF-810935-1) Avail: NTIS HC A02/MF A01

In the effort to model the advection and dispersion of pollutants in the planetary boundary layer over complex terrain, a relatively simple computer code was developed for solving the three dimensional Navier-Stokes equations. The computer code was applied to the simulation of a Boussinesq fluid contained in a three dimensional rectangular box which is heated below and cooled above. Temperature difference between these two isothermal surfaces determines the spatial and temporal thermoconvection patterns. Their relevance to natural convection in solar energy collectors, crystal growth in liquids, radioactive waste storage, and more importantly in studying systems of this sort can provide insight into the onset of phase-chaotic induced turbulence. Numerical simulations of the two flow configuration observed experimentally, the three and two-roll cell patterns are presented. These results appear to be the first calculations to truly time-dependent three dimensional confined Benard convection of elevated Rayleigh numbers. DOE

QUADRANTAL SYMMETRY CALCULATIONS FOR NONSYMMETRIC HALF-PLANE FILTERS
Dennis M. Goodman 3 Dec. 1980 5 p refs Presented at the 14th Asilomar Conf. on Circuits, Systems and Computers, Pacific Grove, Calif., 17 Nov. 1980
(Contract W-7405-eng-48)
(DE81-030071; UCRL-85156-Rev-1; CONF-801170-2) Avail: NTIS HC A02/MF A01

The conditions under which an all-pole, stable, nonsymmetric half plane filter has a quadrantally symmetric magnitude response are investigated. It is shown that quadrantal symmetry is obtained if and only if the denominator of the transfer function can be written as the product of two functions; the inverse z transforms of these two functions have different regions of support and one of them must obey a symmetry condition. The usefulness of these conditions in filter design algorithms is discussed. DOE

SURROGATE DUALITY RELAXATION FOR JOB SHOP SCHEDULING
M. L. Fisher (Pennsylvania Univ.), B. J. Lageweg, J. K. Lenstra, and A. H. G. RinnooyKan (Erasmus Univ.) Aug. 1981 20 p refs Submitted for publication
(Grants NSF ENG-78-26500; NATO-9.2.02(SRG); NATO-1575)
(MC-BW-145/81) Avail: NTIS HC A02/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 3.15

Surrogate duality bounds for the job shop scheduling problem are obtained by replacing the capacity constraints on the machines and the precedence constraints determining the machine order for each job by their weighted sum and strengthening the aggregate constraint by iterating over all possible weights. A theoretical investigation of the resulting relaxations is presented. Results confirm the inherent intractability of the problem, although bounds superior to those obtained by Lagrangean relaxation are produced. Author (ESA)

ON MARTINGALES AND RECURSIVE OPTIMAL STATE ESTIMATION

G. Moek 26 Jun. 1980 92 p refs
(Contract NIVR-1771)
(NLR-TR-80058-U) Avail: NTIS HC A05/MF A01

A number of theoretical results concerning martingales and linear as well as nonlinear estimation theory are summarized in an innovation and presentation theorem. Based upon this, a simple derivation of the Kalman and Kalman-Buoy filters is sketched. Reference is made to more general estimation problems (counting process observations, martingale noise) which can be solved along the same lines. A wide sense martingale approach to linear estimation is discussed. For a class of signals, comprising those studied in the Kalman and Kalman-Buoy problem, recursive estimation equations for the signal based on observations in either white or colored noise are described. A more general model for colored noise is given. By means of numerical simulation of some model problems the Kalman filter and the wide sense martingale approach are compared. T.M.

65 STATISTICS AND PROBABILITY

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

LINEAR NONPARAMETRIC TESTS FOR COMPARISON OF COUNTING PROCESSES, WITH APPLICATIONS TO CENSORED SURVIVAL DATA

Per Kragh Andersen (Danish Medical and Social Science Research Councils), Oernulf Borgan (Copenhagen Univ.), Richard Gill, and Niels Keiding (Danish Medical and Social Science Research Councils) Jul. 1981 41 p refs Submitted for publication Sponsored in part by Norwegian Research Council for Science and the Humanities and by Association of Norwegian Insurance Companies
(MC-SW-72/81) Avail: NTIS HC A03/MF A01; Stichting Mathematisch Centrum, Amsterdam FL 5.25

Linear nonparametric one- and k-sample tests for counting processes are surveyed. The necessary probabilistic background is outlined and a master theorem proved, which may be specialized to most known asymptotic results for linear rank tests for censored data as well as to asymptotic results for one- and k-sample tests in more general situations, an important feature being that very general censoring patterns are allowed. A survey is given of existing tests and their relation to the general theory, and examples of applications to Markov processes are provided. The relation of the approach to classical nonparametric hypothesis testing theory based on permutation distributions is also discussed. M.G.

TABULAR AIDS FOR FITTING WEIBULL MOMENT ESTIMATES

Wallace R. Blischke, L. Guin, and Ernest M. Scheuer (California State Univ., Northridge) Aug. 1981 10 p refs Presented at the Ann. Meeting of the Am. Statist. Assoc.
(Contract N00014-75-C-0733)
(AD-A105965) Avail: NTIS HC A02/MF A01 CSCL 12/1

A table to facilitate fitting moment estimates for a Weibull distribution is given. An estimation procedure is described for use in cases where the sample size is large. M.G.

N82-15843# Research Inst. of National Defence, Linkoeping (Sweden). Huvudavdelning 3.

PROPERTIES OF STOCHASTIC LABELING PROCEDURES

Tommy Elfving and Jan-Olof Eklundh Jun. 1981 31 p refs
(FOA-C-30229-E1) Avail: NTIS HC A03/MF A01

An optimization model for stochastic labeling is formulated and the first order Kuhn-Tucker conditions of the model are derived. The nonzero fixed points of the relaxation scheme by Rosenfeld, Hummel and Zucker are characterized in terms of these conditions. A local convergence result is presented and proved. The use of the relaxation scheme for optimization is illustrated by the problem of classifying a triangle in three dimensional space given two dimensional observations. Results are close to predicted values. Author (ESA)

IDENTIFIER PROTECTION IN A DISTRIBUTED OPERATING SYSTEM

D. M. Nessett 6 Jun. 1981 6 p refs Presented at the Natl. Electron. Conf., Chicago, 26-28 Oct. 1981
(Contract W-7405-eng-48)
(DE81-025978; UCRL-86143; CONF-811020-1) Avail: NTIS HC A02/MF A01

A scheme was recently presented to protect capabilities in a distributed operating system. This scheme uses public-key encryption to ensure that capabilities cannot be stolen in a form useful to the thief nor forged by an unauthorized process or user. Unfortunately, security and efficiency considerations make currently available public-key encryption techniques unattractive. This report focuses on the characteristics an identifier protection scheme must possess and on the use of secret-key encryption to provide identifier protection. DOE

NUMERICAL STUDIES OF GAUGE FIELD THEORIES
Michael Creutz Jun. 1981 28 p refs Presented at the 19th Intern. School of Subnucl. Phys., Erice, Italy, 31 Jul. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030526; BNL-29840; CONF-810762-1) Avail: NTIS HC A03/MF A01

The application of Monte Carlo simulation to quantized gauge field theories is described. Strong numerical evidence that the standard SU(3) non-Abelian gauge theory of the strong interaction is capable of simultaneously confining quarks into the physical hadrons and exhibiting asymptotic freedom is presented. In four dimensions, confinement is a nonperturbative phenomenon. Essentially all models of confinement the widely separated quarks together with strings of gauge field flux. This gives rise to a linear potential at long distances. A Monte Carlo program generates a sequence of field configuration by a series of random changes of the fields. The algorithm is so constructed that ultimately the probability density for finding any given configuration is proportional to the Boltzmann weighting. The lattices are brought into thermal equilibrium with a heat bath at a temperature specified by the coupling constant, performing computer experiments with four dimensional crystals stored in a computer memory. As the entire field configuration is stored, any correlation function desired is accessible. The kinds of experiments being done and the implications of these results for strong interaction physics are described. DOE

APPLICATION OF STEADY STATE FINITE ELEMENT AND TRANSIENT FINITE DIFFERENCE THEORY TO SOUND PROPAGATION IN A VARIABLE AREA DUCT: A COMPARISON WITH EXPERIMENT
Kenneth J. Baumeister, W. Eversman (Missouri Univ., Rolla), R. J. Astley (Missouri, Univ., Rolla), and J. W. White (Tennessee Univ., Knoxville) 1981 14 p refs Presented at the 7th Aeroacoustics Conf., Palo Alto, Calif., 5-7 Oct. 1981; sponsored by AIAA
(NASA-TM-82678; E-960) Avail: NTIS HC A02/MF A01 CSCL 20A

Sound propagation without flow in a rectangular duct with a converging-diverging area variation was studied experimentally and theoretically. The area variation was of sufficient magnitude to produce large reflections and induce modal scattering. The rms (root-mean-squared) pressure and phase angle on both the flat and curved surface were measured and tabulated. The steady state finite element theory and the transient finite difference theory are in good agreement with the data. It is concluded that numerical finite difference and finite element theories appear ideally suited for handling duct propagation problems which encounter large area variations. M.G.

A STUDY OF METHODS OF PREDICTION AND MEASUREMENT OF THE TRANSMISSION SOUND THROUGH THE WALLS OF LIGHT AIRCRAFT Semiannual Report
B. Forssen, Y. S. Wang, and Malcolm J. Crocker Dec. 1981 24 p refs
(Grant NAG1-58)
(NASA-CR-165040; Rept-2; HL-81-34) Avail: NTIS HC A02/MF A01 CSCL 20A

Several aspects were studied. The SEA theory was used to develop a theoretical model to predict the transmission loss through an aircraft window. This work mainly consisted of the writing of two computer programs. One program predicts the sound transmission through a plexiglass window (the case of a single partition). The other program applies to the case of a plexiglass window window with a window shade added (the case of a double partition with an air gap). The sound transmission through a structure was measured in experimental studies using several different methods in order that the accuracy and complexity of all the methods could be compared. Also, the measurements were conducted on the simple model of a fuselage (a cylindrical shell), on a real aircraft fuselage, and on stiffened panels. B.W.

SOUND MEASUREMENT IN FLOWS: DETERMINATION OF THE NOISE LEVEL DUE TO TURBULENT PRESSURE VARIATIONS BY COMPARING THE MEASUREMENTS WITH A NOSE CONE AND WITH A SLOTTED TUBE [SCHALLMESSUNGEN IN STROEMUNGEN - BESTIMMUNG DES STOERPEGELS INFOLGE TURBULENTER DRUCKSCHWANKUNGEN DURCH VERGLEICHSMESSUNG MIT NASENKONUS UND SCHLITZROHR]
W. Neise 1981 4 p refs In GERMAN
Avail: NTIS HC A02/MF A01

A method for the separation of sound and noise signals in flow channels is described. The two signals as a function of frequency are compared. It is assumed that sound and turbulent noise signals are statistically independent, and that the microphone noise levels are different when using a nose cone or a slotted tube. The use of comparative measurement is simple in the frequency domain of plane waves, the wave propagation being parallel to the channel axis and the sound pressure being constant in a cross section. The case of higher modes in the channel is considerably more problematic and requires laborious measurements and treatments. Author (ESA)

NOISE REDUCTION DURING THE PRODUCTION OF THICK WALLED STEEL CONSTRUCTIONS BY MEANS OF IMPACT PROCESSING TECHNIQUES Final Report, Jul. 1980
Bernard Dupuis Bonn Bundesministerium fuer Forschung und Technologie Jun. 1981 84 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-HA-81-008) Avail: NTIS HC A05/MF A01; fachinformationszentrum, Karlsruhe, West Germany DM 17,60

A number of measures are described that can be taken to reduce the noise generated by techniques using impactors in the production of thick walled steel constructions. In most workshops, the noise usually exceeds by far the legal noise limit. Suggestions, based on laboratory tests, are made for noise reduction by modification of the manufacturing procedure, by adaptation of the tools, and by diminishing the excitation and emission characteristics of the body under construction. By means of specific examples of container and steelframe construction, it is demonstrated that noise generated by impact processes can indeed be reduced to a large extent. Author (ESA)

(Contract DE-AS05-76ER-05126)
(DE81-026272; CONF-810747-3; ORO-5126-145) Avail: NTIS HC A02/MF A01

Recent progress in diffraction theory shows that proton-nucleus scattering at nonforward angles is dominated by the interference of waves from two or more bright spots. Analytic formulas based on asymptotic theories of diffraction have yielded valuable new insights into the scattering and these formulas can be readily extended to illuminate the role of dynamical ingredients, i.e., the nucleon-nucleon amplitudes. The governing parameters of the diffraction and some direct connections between the observed cross sections and the input dynamics are reviewed. New information regarding the nucleon-nucleon parameters based on recent phase shift analyses show some systematic differences from the effective NN amplitudes which produce fits to proton-nucleus diffraction data. Recent progress in understanding the role of delta isobars in proton-nucleus dynamics is reviewed. DOE

HYPERNUCLEI AND INTERACTIONS OF KAONS WITH NUCLEI
Carl B. Dover 1981 18 p refs Presented at the 9th Intern. Conf. on High Energy Phys. and Nucl. Structure, Versailles, France, 6-10 Jul. 1981
(Contract DE-AC02-76CH-00015)
(DE81-028467; BNL-29774; CONF-810747-1) Avail: NTIS HC A02/MF A01

Different models for hyperon-nucleus central and spin-orbit potentials are compared: several models yield a very small spin-orbit strength for the lambda, as experimentally observed, but differ considerably in their predictions for the sigma. The new data on the C-13 hypernuclear spectrum, as obtained in the strangeness exchange reaction at 800 MeV/c, are discussed. It is shown how one extracts constraints on the lambda nucleus and effective lambda nucleon interactions from the data. The new BNL data on the (anti kaon, pion) reaction at 720 MeV/c, leading to sigma hypernuclear states, are examined. The case of Li-6(anti kaon, pion)H-6 reaction is discussed, and some speculations concerning the (anti kaon, pion) reaction on other targets are presented. The physical mechanisms which may lead to unusually narrow sigma excitations in some systems are examined. The physics motivations for several future hypernuclear experiments which are already under development, or under preliminary consideration are reviewed. DOE

PARAMETERIZATION OF THE BREMSSTRAHLUNG SPECTRUM

I. J. Feng and R. H. Pratt 31 Aug. 1981 52 p
(Contract W-7405-eng-48)
(DE81-029739; UCRL-15384; PITT-266) Avail: NTIS
HC A04/MF A01

A parameterization is provided for the bremsstrahlung spectrum in the incident electron energy range 10 to 500 keV for all elements, with particular emphasis on the range 20 to 100 keV for Z = 41 to 92. A general accuracy of 20% is achieved, with 50% in the worst cases, in most ranges utilizing simple one variable functions. DOE

CONTINUUM ELECTRON EMISSION IN HEAVY ION: ATOM COLLISONS

L. H. Toburen Feb. 1981 57 p refs Presented at the Seminar on High Energy Ion-Atom Collision Processes, Debrecen, Hungary, 17 Mar. 1981
(Contract DE-AC06-76RL-01830)
(DE81-028234; PNL-SA-9306; CONF-810392-1) Avail: NTIS
HC A04/MF A01

The measurement of energy losses of heavy ions in molecular targets is reviewed. Topics covered include ionization by protons, ionization by helium ions, and ionization by carbon impact. An appendix gives a data compilation of ejected energies and ejected electron energies and ejection angles for proton collision with H2, He, Ne, Ar, Kr, Xe, N2, O2, H2O, CH4, C2H2, C2H4, C2H6, C6H6, NH3, CH3NH2, C2H5NH2, SF6, and TeF6. Double differential cross sections are included for several ion molecular collisions. DOE

ILLUSTRATIVE NUMERICAL COMPARISONS BETWEEN PHONON MEAN FREE PATHS AND PHONON THERMAL CONDUCTIVITY

W. M. MacDonald and A. C. Anderson 1981 9 p refs Presented at the Intern. Joint Conf. on Thermophys. Properties, Gaithersburg, Md., 15 Jun. 1981
(Contract DE-AC02-76ER-01198)
(DE81-028180; DOE/ER-01198/1361; CONF-810683-5) Avail: NTIS HC A02/MF A01

Measurements of thermal conductivity are often used as an interrogative technique to learn about phonon scattering processes in solids. In general the relationship between thermal conductivity lambda and a phonon mean free path 1 is complex and it is therefore necessary to make some simplifying assumptions in order to make this relationship tractable. These assumptions may lead to erroneous conclusions, many of which have appeared in the published literature. An intuitive insight is provided to the relationship between lambda and 1. DOE

DETERMINATION OF NUCLEAR-MATTER TEMPERATURE AND DENSITY

Kevin L. Wolf 1980 58 p refs Presented at the Workshop on Future Relativistic Heavy Ion Expt., Darmstadt, West Germany, 7-10 Oct. 1980
(Contract W-31-109-eng-38)
(DE81-023847; CONF-8010154-4) Avail: NTIS
HC A04/MF A01

Information learned about nuclear matter under extreme conditions during the past few years in relativistic heavy ion studies are reviewed. The completion of analyses and publication of results from the impact parameter-selected, single-particle inclusive experiments is discussed. Preliminary results from the new generation of two-particle correlation and particle-exclusive measurements, especially those using streamer chambers are considered. The measurement of more exotic ejectiles with long mean free paths in nuclear matter is discussed. Calculations offering guidance and providing explanations of high energy collisions, particularly the Monte Carlo and intranuclear cascade calculations, are evaluated. DOE

MID-RAPIDITY PION CROSS SECTIONS: NEW DATA CONFRONT THEORIES

K. A. Frankel, J. A. Bistirlich, R. Bossingham, H. R. Bowman, K. M. Crowe, C. J. Martoff, J. Miller, D. L. Murphy, J. O. Rasmussen, J. P. Sullivan et al Jul. 1981 6 p refs Presented at the 5th High Energy Heavy Ion Study, Berkeley, Calif. 18-22 May 1981
(Contract W-7405-eng-48)
(DE81-028014; LBL-12641; CONF-8105104-5) Avail: NTIS
HC A02/MF A01

Pion production by collisions of relativistic heavy ions has been studied recently. For the reaction 1.05 GeV/A Ar + Ca pion (+), they discovered a peak in the invariant cross section at mid-rapidity at P/sub perpendicular/approximately 0.5 m/sub pion/c. This peak is not apparent in the 730 MeV p(+)p and was attributed to possible hydrodynamic flow effects. Several authors have suggested that the pion(+) peak is a Coulomb effect. These models predict the pion(-) would be drawn in towards the fireball, leaving an essentially flat distribution in the mid-rapidity region. Mid-rapidity pion(+) and pion(-) cross sections were measured using at 1.05 GeV/A argon beam with a calcium target. The pions were measured with a magnetic spectrometer set at 15 degrees to the beam and were stopped in a scintillator range telescope. Results are presented and discussed. DOE

THEORY OF COULOMB DISTORTION OF PION SPECTRA BY HEAVY-ION SPECTATOR FRAGMENTS

J. O. Rasmussen, H. M. A. Radi (Kuwait Univ.), J. P. Sullivan, K. A. Frankel, , and O. Hashimoto (Tokyo Univ., Japan) Jul. 1981 7 p refs Presented at the 5th High Energy Heavy Ion Study, Berkeley, Calif., 18-22 May 1981
(Contract W-7405-eng-48)
(DE81-028013; LBL-12623; CONF-8105104-7) Avail: NTIS HC A02/MF A01

It has been known for over two years now that the pion(-) spectrum from heavy ion collisions peaks near beam velocity and that the pion (+) spectrum has a corresponding depression. It has been guessed that these features are Coulomb effects of projectile fragments. A theoretical treatment of this phenomena is given, and results are compared with experimental data. DOE

PHONONS IN GRAPHITE INTERCALATION COMPOUNDS MEASURED BY NEUTRON SCATTERING

A. Magerl and H. Zabel (Illinois Univ. at Urbana-Champaign) 1981 8 p refs Presented at the Conf. on Phys. of Intercalation Compounds, Trieste, Italy, 6 Jul. 1981
(Contract DE-AC02-76ER-01198)
(DE81-029681; DOE/ER-01198/1354; CONF-810758-1) Avail: NTIS HC A02/MF A01

The entire phonon dispersion of a solid can be measured by neutron scattering under favorable conditions. Triple axis spectroscopy allows the phonon energies to be determined for a chosen polarization at well defined wave vectors q throughout the Brillouin zone (BZ). In the case of graphite a complete measurement of the phonon dispersion is not possible because of the limited size of (natural) single crystals, and because of the high energy approximately 200 meV of some branches. Only a limited amount of neutron data have been collected with pyrolytic graphite (PG). The high energy branch of stage 3 K together with complete (001) L dispersions for stage 2 K, Rb and Cs and stage I K and Cs are presented for the first time. It is shown that a Born-vanKarman formalism is inappropriate, however, including an interaction with an electronic layer between alkali and bonding graphite planes results in a shell model, which can consistently describe the measurement for all compounds.

STRESS DEPENDENCE OF CREEP IN Ni BOMBARDED WITH 17-MeV DEUTERONS

C. H. Henager, Jr., E. P. Simonen (Washington Univ., Seattle), E. R. Bradley, and R. G. Stang Jul. 1981 6 p refs Presented at the 2nd Fusion Reactor Mater. Meeting, Seattle, 9-12 Aug. 1981
(Contract DE-AC06-76RL-01830)
(DE81-030080; PNL-SA-9728; CONF-810831-54) Avail: NTIS HC A02/MF A01

A linear stress dependence of irradiation creep was observed in pure, heavily cold-worked Ni and the creep behavior was modeled using a climb-glide creep mechanism. The Ni foils were bombarded with 17 MeV deuterons at 473 K with a damage rate of 0.0000006 dpa/s. The applied tensile stress ranged from 135 MPa to 250 MPa. Transmission electron microscopy revealed that up to 50% of the material had recrystallized during the pre-irradiation thermal creep test. A high number density of interstitial loops were observed throughout the material. Small voids were observed primarily in the recrystallized regions. The creep rate magnitude and stress dependence was rationalized using models of loop hardening of rate theory predictions of point defect annihilation at sinks. DOE

TRITIUM AUTORADIOGRAPHY

George R. Caskey, Jr. 1981 28 p refs Presented at the TMS/AIME Fall Meeting on Advanced Tech. for the Characterization of Hydrogen in Metals, Louisville, Ky., 11-15 Oct. 1981
(Contract DE-AC09-76SR-00001)
(DE81-030521; DP-MS-81-12; CONF-811037-1) Avail: NTIS HC A03/MF A01

Hydrogen distribution and diffusion within many materials may be investigated by autoradiography if the radioactive isotope tritium is used in the study. Tritium is unstable and decays to helium-3 by emission of a low energy (18 keV) beta particle which may be detected photographically. The basic principles of tritium autoradiography were discussed. Limitations are imposed on the technique by: (1) the low energy of the beta particles; (2) the solubility and diffusivity of hydrogen in materials; and (3) the response of the photographic emulsion to beta particles. These factors control the possible range of application of tritium autoradiography. The technique was applied successfully to studies of hydrogen solubility and distribution in materials and to studies of hydrogen damage. DOE

ONE AND A HALF CENTERED EXPANSION FOR ION-ATOM COLLISIONS

J. F. Reading, A. L. Ford, and R. L. Becker 1980 21 p refs Presented at the Interm. Conf. on X-ray Processes and Inner-shell Ionization, Stirling, UK, 25 Aug. 1980 Prepared in cooperation with Texas A and M Univ.
(Contract W-7405-eng-26)
(DE81-028142; CONF-800859-8) Avail: NTIS HC A02/MF A01

Fast ion-atom collisions in which charge transfer plays a dominant role have been traditionally treated by a two center expansion (TCE): the state wavefunction is approximated by a truncated set of Hilbert states centered on the target and projectile. This method is accurate but expensive in the use of computer time. A new method which allows charge transfer through variational time independent amplitudes, and target excitation and ionization through variation time dependent amplitudes is presented. The method retains the efficiency of a single centered expansion and yet reproduces the conventional TCE results in situations where charge transfer is dominant. Comparison to experiment is made. DOE

DISSIPATIVE REACTION DYNAMICS OF HEAVY-ION COLLISIONS

W. U. Schroeder and J. R. Huizenga *In its* Studies of Heavy-Ion Reactions and Transuranic Nuclei Jul. 1981 p 20-46 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

The transition from the very simple quasi-elastic to the vastly complex fusion type reactions involving up to several thousand nucleonic degrees of freedom was studied. Nuclear reactions induced by heavy ions at bombarding energies of a few MeV/u above the interaction barrier differ in several important ways from the more conventional processes observed with light projectiles such as protons, deuterons and alfa-particles. In light ion induced reactions two mechanisms are distinguished: (1) quasi-elastic pickup or stripping of one or a few nucleons and, (2) compound nucleus formation following the fusion of projectile and target nuclei. Heavy ion reactions constitute a reaction mechanism intermediate between quasi-elastic and fusion processes. These binary reactions, termed damped or deep inelastic collisions, arise because of the very strong repulsive Coulomb and centrifugal forces retarding or even inhibiting the fusion process. E.A.K.

N82-15882# Rochester Univ., N. Y. Nuclear Structure Research Lab.

A TWO DIMENSIONAL POSITION SENSITIVE DELTAE-E COUNTER FOR ENERGETIC LIGHT CHARGED PARTICLES

W. W. Wilcke, J. R. Birkelund, J. P. Kosky, H. J. Wollersheim, A. D. Hoover, J. R. Huizenga, W. U. Schroeder, L. E. Tubbs, and D. Hilscher (Hahn-Meitner Inst.) *In its* Studies of Heavy-Ion Reactions and Tranuranic Nuclei Jul. 1981 p 47-79 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

A large area position sensitive deltaE-E detector for energetic light charged particles is described. A single wire gas proportional counter is used as the deltaE-E detector. Two dimensional position readout is obtained from the proportional counter by a combination of charge division and electron drift time measurements. The detector is suitable for alpha particles with energies between 6.5 and 180 MeV. The application of the detector to study charged particle emission in a heavy ion induced reaction is discussed. E.A.K.

N82-15883# Rochester Univ., N. Y. Nuclear Structure Research Lab.

REACTION PARAMETERS FOR HEAVY-ION COLLISIONS

W. W. Wilcke, J. R. Birkelund, H. J. Wollersheim, A. D. Hoover, J. R. Huizwega, W. U. Schroeder, and L. E. Tubbs *In its* Studies of Heavy-Ion Reactions and Transuranic Nuclei Jul. 1981 p 81-106 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

Reaction parameters for all combinations of 27 projectile and 16 target nuclei in a laboratory bombarding energy range of 1-50 MeV/u are presented. The reaction parameters are derived from the Fresnel model of heavy ion scattering, the droplet model and the rotating liquid drop model or from systematics of experimental data. E.A.K.

N82-15884# Rochester Univ., N. Y. Nuclear Structure Research Lab.

HEAVY-ION FUSION REVISITED

J. R. Huizenga, J. R. Birkelund, W. U. Schroeder, W. W. Wilcke, and H. J. Wollersheim *In its* Studies of Heavy-Ion Reactions and Transuranic Nuclei Jul. 1981 p 108-133 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

Heavy ion fusion cross sections for a selected number of reactions are presented. For the lighter systems emphasis is placed on the high energy part of the fusion evaporation excitation functions. For lighter systems and not too high energies, the fusion process is experimentally rather well distinguishable because of the dominance of compound nucleus formation. For intermediate systems, fusion-fission competition begins to dominate over fusion evaporation for angular moments of approximately 65K. The experimental fusion-fission cross sections of the very heavy systems indicate that the topology of the underlying potential energy surface of relevance for the fusion process is not well approximated by a barrier in a one dimensional picture. A simple model description of fusion inhibition induced by the dynamical evolution along a neck degree of freedom is applied to a variety of fusion-fission excitation functions. The dependence of dynamical fusion inhibition on pertinent features of the multidimensional potential energy surface are also studied. E.A.K.

N82-15885# Rochester Univ., N. Y. Nuclear Structure Research Lab.

THE 209Bi + 136Xe REACTION AT E SUB LAB = 1422 MeV

H. J. Wollersheim, W. W. Wilcke, J. R. Birkelund, J. R. Huizenga, W. U. Schroeder, H. Freiesleben, and D. Hilscher *In its* Studies of Heavy-Ion Reactions and Transuranic Nuclei Jul. 1981 p 134-176 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

Projectile like reaction products from the 209Bi + 136Xe reaction bombarding energy of 1422 MeV were studied. The fragments were identified by atomic number, and their kinetic energies and angular distributions were measured using three solid state deltaE-E telescopes. The angular distribution is peaked near the grazing angle. The minimum kinetic energy is bombarding energy independent and 150 MeV smaller than the Coulomb energy of touching spherical fragments which indicates a large deformation of these dinuclear systems. The measured element distributions for given Q-values are Gaussian and centered at the atomic number of the projectile. At large negative Q-values, the centeroids of the Gaussian distributions exhibit a small drift towards charge splits more asymmetric than the initial system. E.A.K.

N82-15886# Rochester Univ., N. Y. Nuclear Structure Research Lab.

THE 165Ho + 56Fe REACTION AT E SUB LAB = 462 MeV

A. D. Hoover, J. R. Birkelund, D. Hilscher, W. U. Schroeder, W. W. Wilcke, J. R. Huizenga, H. Breuer (Maryland Univ., College Park), A. C. Mignerey (Maryland Univ., College Park), V. E. Viola, Jr. (Indiana Univ., Bloomington), and K. L. Wolf (Argonne National Lab., Ill.) *In its* Studies of Heavy-Ion Reactions and Transuranic Nuclei Jul. 1981 p 178-258 refs (For primary document see N82-15879 06-72)
Avail: NTIS HC A12/MF A01

The Z-distributions measured as a function of angle and energy are discussed. The integrated fragment Z-distribution of the light reaction fragment is fairly broad and centered close to the charge of the projectile. The kinetic energy distribution extends from the quasi-elastic region down to energies smaller than the Coulomb energy of touching spherical nuclei. The angular distribution is peaked forward of the quarter point angle and rises at small angles which are due to orbiting. Charge distributions show an average drift towards larger asymmetry and an increase in width with increasing energy damping. The Coulomb barrier is considered for two choices of the scission radius. E.A.K.

POTENTIAL DETERMINATION OF THE SYSTEM SODIUM (3 2P) PLUS MERCURY (6 1S) BY MEASURING AND ANALYZING THE RAINBOW SCATTERING IN THE SUPER-THERMAL ENERGY DOMAIN BETWEEN 0.3 AND 3.2eV Thesis - Georg-August-Univ. [POTENTIALBESTIMMUNG DES SYSTEMS Na (3 2P) + Hg (6 1S) DURCH MESSUNG UND ANSWERTUNG DER REGENBOGENSTREUUNG IM UEBERTHERMISCHEN ENERGIEBEREICH VON 0,7 BIS 3,2eV]

Lutz Huewel Dec. 1980 122 p refs In GERMAN
(MPIS-23/1980; ISSN-0436-1199) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 20,65

The differential scattering cross section of the collision system Na (3 2 P) + Hg (6 1S) was determined, using rainbow oscillations. Electronically laser excited Na atoms were scattered by Hg and fluorescence was observed. The experimental setup consists basically of two (Na and Hg) atomic beams and an out of plane detection system. With a fast Na atomic beam, capable of reaching velocities above 5000 m/sec and providing collision energies of 3eV. Two well separated rainbow oscillatory systems were demonstrated in the differential scattering cross section. Both rainbow systems show strong amplitude dependence on the laser light polarization state. Author (ESA)

UNIVERSITY OF WASHINGTON NUCLEAR PHYSICS DATA COLLECTION SYSTEM

Kelly C. Green 1981 9 p Presented at the Topical Conf. on Computerized Data Acquisition in Particle and Nucl. Phys., Oak

Ridge, Tenn., 28 May 1981
(Contract DE-AC06-76ER-01388)
(DE81-028321; DOE/ER-01388/496; CONF-810523-11) Avail: NTIS HC A02/MF A01

A data collection system was developed, replacing a previous system based on an SDS-930 computer. The system is constructed about a PDP 11/60 and an MBD-11 controlled CAMAC crate. The hardware configuration as well as a locally written singles data collection code are described. Multiparameter data is taken with an enhanced version of Fermilab Multi. Current capabilities and future plans are discussed. DOE

POLYNOMIAL CHROMODYNAMICS
Herbert M. Ruck Jun. 1981 6 p refs Presented at the 5th High Energy Heavy Ion Study, Berkeley, Calif., 18-22 May 1981
(Contract W-7405-eng-48)
(DE81-028038; LBL-12872; CONF-8105104-6) Avail: NTIS HC A02/MF A01

A model of classical field theory with internal symmetry Z(3) is partially solved in 1 + 1 dimensions. The dynamical variables are two pairs of scalar and spinor fields phi sub 1, phi sub 2 and phi sub 1, phi sub 2. The phi and psi fields form composite finite-size particles. The mass spectrum and the interactions of these particles is studied. DOE

FACTORS AFFECTING CRITICALITY FOR SPENT-FUEL MATERIALS IN A GEOLOGIC SETTING
B. F. Gore, U. P. Jenquin, and R. J. Serne Apr. 1981 210 p refs
(Contract DE-AC06-76RL-01830)
(DE81-029275; PNL-3791) Avail: NTIS HC A10/MF A01

The conditions required for the criticality of spent fuel constituents are determined. The calculational methods and computer codes used to determine critical conditions are described. Effects of the fissile content of spent fuel on criticality are examined. Pu quantities and concentrations are required for criticality without water were determined for various conditions of Pu separation, rock moderation and reflection, rock impurities, and isotopic content of the Pu. The possibility of geochemical processes separating Pu from other spent fuel constituents is addressed. Solubilities of U and Pu are calculated for groundwaters characteristic of basalt, tuff, granite, bedded and dome salt. Maximum concentrations which could be adsorbed on geologic media in contact with these groundwaters are then calculated. DOE

Avail: NTIS HC A15/MF A01 CSCL 20F

A computational model of the processes involved in multispectral remote sensing and data classification is developed as a tool for designing smart sensors which can process, edit, and classify the data that they acquire. An evaluation of sensor system performance and design tradeoffs involves classification rates and errors as a function of number and location of spectral channels, radiometric sensitivity and calibration accuracy, target discrimination assignments, and accuracy and frequency of compensation for imaging conditions. This model provides a link between the radiometric and statistical properties of the signals to be classified and the performance characteristics of electro-optical sensors and data processing devices. Preliminary computational results are presented which illustrate the editing performance of several remote sensing approaches. S.L.

The role that optical computers play in aircraft control is determined. The optical computer has the potential high speed capability required, especially for matrix/matrix operations. The optical computer also has the potential for handling nonlinear simulations in real time. They are also more compatible with fiber optic signal transmission. Optics also permit the use of passive sensors to measure process variables. No electrical energy need be supplied to the sensor. Complex interfacing between optical sensors and the optical computer is avoided if the optical sensor outputs can be directly processed by the optical computer. S.L.

HIGH SPEED TECHNIQUES FOR SYNTHETIC APERTURE RADAR IMAGE FORMATION

Demetri Psaltis (California Inst. of Tech., Pasadena), Armand R. Tanguay, Jr. (Univ. of Southern California, Los Angeles), and Thomas J. Bicknell *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 47-52 (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

One possible approach to high speed synthetic aperture radar signal reconstruction involves the utilization of two dimensional real time spatial light modulators as recyclable replacements for photographic film in the input transducer plane of a modified synthetic aperture radar (SAR) coherent optical processor. Leading candidate spatial light modulators include modified Pockels readout optical modulators (PROM), charge coupled devices (CCD) addressed liquid crystal light valves, and CCD addressed membrane light modulators. The fundamental physical limitations affecting SAR processor performance characteristics of such real time devices are under investigation. Current research on PROM is focused on the effects of device operational mode, device constitutive parameters, electro-optic crystal orientation, writing wavelength, frame rate/data overwrite/presuming, erasure completeness, and image retention on the overall quality of SAR image formation. Both modulated laser scanning and intensified CRT temporal to spatial input approaches are being examined. S.L.

BULK AND INTEGRATED ACOUSTO-OPTIC SPECTROMETERS FOR RADIO ASTRONOMY

G. Chin, D. Buhl, and J. M. Florez *In* NASA. Langley Research Center Opt. Inform. Process for Aerospace Appl. Dec. 1981 p 85-91 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

The development of sensitive heterodyne receivers (front end) in the centimeter and millimeter range, and the construction of sensitive RF spectrometers (back end) enable the spectral lines of interstellar molecules to be detected and identified. A technique was developed which combines acoustic bending of a collimated coherent light beam by a Bragg cell followed by detection by a sensitive array of photodetectors (thus forming an RF acousto-optic spectrometer (AOS). An AOS has wide bandwidth, large number of channels, and high resolution, and is compact, lightweight, and energy efficient. The thrust of receiver development is towards high frequency heterodyne systems, particularly in the millimeter, submillimeter, far infrared, and 10 micron spectral ranges. S.L.

ENERGY NORMALIZATION OF TV VIEWED OPTICAL CORRELATION (AUTOMATED CORRELATION PLANE ANALYZER FOR AN OPTICAL PROCESSOR)

Alex Grumet *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 93-104 (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

An automatic correlation plane processor that can rapidly acquire, identify, and locate the autocorrelation outputs of a bank of multiple optical matched filters is described. The read-only memory (ROM) stored digital silhouette of each image associated with each matched filter allows TV video to be used to collect image energy to provide accurate normalization of autocorrelations. The resulting normalized autocorrelations are independent of the illumination of the matched input. Deviation from unity of a normalized correlation can be used as a confidence measure of correct image identification. Analog preprocessing circuits permit digital conversion and random access memory (RAM) storage of those video signals with the correct amplitude, pulse width, rising slope, and falling slope. TV synchronized addressing of 3 RAMs permits on-line storage of: (1) the maximum unnormalized amplitude, (2) the image x location, and (3) the image y location of the output of each of up to 99 matched filters. A fourth RAM stores all normalized correlations. A normalization approach, normalization for cross correlations, a system's description with block diagrams, and system's applications are discussed. M.D.K.

INTERFEROMETRIC SURFACE-WAVE ACOUSTO-OPTIC TIME-INTEGRATING CORRELATORS

Norman J. Berg, Irwin J. Abramovitz, and Michael W. Casseday *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 119-129 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

A structure for a coherent-interferometric acousto-optic (AO) time-integrating correlator was implemented by using a single surface acoustic wave (SAW) device with tilted transducers to reduce intermodulation terms. The SAW device was fabricated on Y-Z LiNbO3 with a center frequency of 175 MHz, a bandwidth of 80 MHz, and a time-aperture of about 10 micros. The density of the photodetector array, with a potential of 120 MHz. Typical integration times are 30 to 40 ms, providing processing gains in excess of 10 to the 6th power. Such a device is useful in providing fast synchronization of communication links and in demodulating to base band and simultaneously acting as a synchronization lock monitor for moderate data rates. Where processing may be limited by Doppler shifts, a two dimensional architecture was implemented to allow full processing gain. Two one-dimensional, SAW AO time-integrating correlators and a two dimensional correlator are evaluated. M.D.K.

THREE METHODS FOR PERFORMING HANKEL TRANSFORMS

R. A. Athale, H. H. Szu, and J. N. Lee *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 133-144 (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Three methods for performing Hankel transforms with optical or digital processors are described. The first method is applicable when the input data is available in Cartesian (x-y) format and uses the close connection between generalized Hankel transform and the two dimensional Fourier transform in Cartesian coordinates. The second method is useful when the input data is in polar (r - theta) format and uses change of variables to perform the nth order Hankel transform as a correlation integral. The third method utilizes the von Neumann addition theorem for Bessel functions to extract the Hankel coefficients from a correlation between the radial part of the input and a Bessel function. Initial experimental results obtained for optical implementation of the first two methods are presented. M.D.K.

N82-15907*# California Univ., San Diego. Dept. of Electrical Engineering and Computer Sciences.

OPTICAL RECOGNITION OF STATISTICAL PATTERNS

Sing H. Lee *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 145-166 refs Sponsored by NSF and AFOSR (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Optical implementation of the Fukunaga-Koontz transform (FKT) and the Least-Squares Linear Mapping Technique (LSLMT) is described. The FKT is a linear transformation which performs image feature extraction for a two-class image classification problem. The LSLMT performs a transform from large dimensional feature space to small dimensional decision space for seperating multiple image classes by maximizing the interclass differences while minimizing the intraclass variations. The FKT and the LSLMT were optically implemented by utilizing a coded phase optical processor. The transform was used for classifying birds and fish. After the F-K basis functions were calculated, those most useful for classification were incorporated into a computer generated hologram. The output of the optical processor, consisting of the squared magnitude of the F-K coefficients, was detected by a T.V. camera, digitized, and fed into a micro-computer for classification. A simple linear classifier based on only two F-K coefficients was able to separate the images into two classes, indicating that the F-K transform had chosen good features. Two advantages of optically implementing the FKT and LSLMT are parallel and real time processing. M.D.K.

OPTICAL SPATIAL INTEGRATION METHODS FOR AMBIGUITY FUNCTION GENERATION

P. N. Tamura, J. J. Rebholz, O. T. Daehlin, and T. C. Lee *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 167-172 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

A coherent optical spatial integration approach to ambiguity function generation is described. It uses one dimensional acousto-optic Bragg cells as input tranducers in conjunction with a space variant linear phase shifter, a passive optical element, to generate the two dimensional ambiguity function in one exposure. Results of a real time implementation of this system are shown. M.D.K.

N82-15909*# Hughes Research Labs., Malibu, Calif.

THE INTEGRATED OPTIC RF SPECTRUM ANALYZER

M. E. Pedinoff, T. R. Ranganath, T. R. Joseph (Hughes Aircraft Co., Fullerton, Calif.), and J. Y. Lee (Hughes Aircraft Co., Carlsbad, Calif.) *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 173-208 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

The results of measurements made on a fully integrated optic RF spectrum analyzer (IOSA) are reported. The performance of the device acousto-optic bandwidth, single-tone RF resolution, two-tone RF resolution, single-tone dynamic range, two-tone dynamic range, and single-tone RF response are presented. The device parameters that control device performance are analyzed. These results demonstrate the viability of the IOSA for real time spectrum analysis of pulsed and CW RF signals. Improvements of RF bandwidth resolution can be obtained by the use of larger collimated optical beams which requires larger optical lens elements, and hence, larger crystals. Author

APPLICATIONS OF ELECTRO-OPTIC GRATINGS IN INTEGRATED OPTICAL SIGNAL PROCESSING DEVICES

Carl M. Verber *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 209-215 refs Sponsored in part by AFOSR (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

A variety of applications of electro-optically induced Bragg gratings in integrated optical signal processing and computation devices are shown. The gratings are easy to fabricate, operate efficiently on relatively low voltages and have design principles which are well known and reliable. The component allows a rapid and efficient interaction with an optical wave in a planar electro-optic waveguide. The operation of such gratings and their use as intensity modulators, spatial light modulators, and components in correlators and in a variety of computational units is described. M.D.K.

N82-15911*# Virginia Univ., Charlottesville.

FOUR- AND FIVE-LAYER SILICON-CLAD DIELECTRIC WAVEGUIDES

Glen McWright and T. E. Batchman *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 217-230 refs (For primary document see N82-15894 06-74) (Grant NsG-1567)
Avail: NTIS HC A15/MF A01 CSCL 20F

Computer modeling studies conducted on four-layer silicon-clad dielectric waveguides indicate that the attenuation (alpha) and mode index (beta/K) behave as exponentially damped sinusoids as the silicon thickness is increased. The observed effect can be explained quite simply as a periodic coupling between the guided modes of the lossless structure and the lossy modes supported by the high-refractive index silicon. The attenuation and mode index are significantly altered by conductivity changes in the silicon; an amplitude modulator and an intensity modulator were proposed using these results. Predicted high attenuations in the device may be reduced significantly with a silicon dioxide buffer layer between the semiconductor and the polystyrene guide. Experimental confirmation of the predicted characteristics is still necessary. A number of thin-silicon film waveguides have been RF sputtered but attenuation measurements to verify the damped oscillatory behavior are forthcoming. Conductivity variations of the silicon should demonstrate the modulation capabilities. Author

AlGaAs/GaAs TRANSVERSE JUNCTION STRIPE LASERS WITH DISTRIBUTED FEEDBACK

M. J. Hafich, R. A. Skogman, P. E. Petersen, and H. Kawanishi (Kogakuin Univ.) *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 241-250 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Transverse junction stripe (TJS) lasers with periodic feedback were fabricated in two geometries. An interferometric and wet chemical etching technique was used to create a feedback grating across the entire pumping region for the distributed feedback (DFB) TJS laser and to create the seperate distributed Bragg reflectors/DBR) for the TJS/DBR laser. The TJS/DFB laser was a double heterostructure device grown by liquid phase epitaxy (LPE) and had a third order grating etched in the top ALO.2GaO.8As layer. The grating was buried by growing an ALO.35GaO.65As layer on the grating by metal organic chemical vapor deposition (MO-CVD). The TJS/DBR laser was also fabricated in an LPE double heterostructure. The top AlGaAs layer was thinned to 0.1 micron over more than half of the laser so that the grating would be close to the GaAs active layer and optical field. Single mode operation in both configurations was obtained. The thermal shift of the laser wavelength in both cases was less than 1 Angstrom/deg K, compared to the 3 Angstrom/deg K shift of the spontaneous emission peak. N.W.

N82-15914*# Battelle Columbus Labs., Ohio.

EVAPORATED As2S3 LUNEBURG LENSES FOR LiNbO3:Ti OPTICAL WAVEGUIDES

James R. Busch, Van E. Wood, Richard P. Kenan, and Carl M. Verber *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 251-261 refs Sponsored in part by AFOSR (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Luneburg lenses of good quality were formed on high index optical waveguides by evaporation of arsenic trisulfide glass through simple masks. Using only two thin circular aperture masks, lenses with focal spots of a few times the diffraction limited width at f/4 were obtained. These lenses were designed for and tested at both visible (633 nm) and infrared wavelengths. Procedures for the design, fabrication, and testing of lenses of this type are described. N.W.

N82-15915*# Hazeltine Corp., Greenlawn, N. Y.

A BROADBAND RF CONTINUOUSLY VARIABLE TIME DELAY DEVICE

Frederick W. Freyre *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 265-274 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

A method for implementation of continuously variable time delay of broadband RF signals is described. The method uses Bragg Cell and optical heterodyne technology. The signal to be delayed is applied to the Bragg Cell acoustic transducer, and the delay time is the acoustic transit time from this transducer to the incident light beam. By translating the light beam, the delay is varied. Expressions describing the Bragg Cell diffraction, lens Fourier transformation, and the optical heterodyne processes are developed. Specifications for the variable delay including bandwidth, range of delay, and insertion loss are provided. Applications include radar signal processing, spread spectrum intercept, radar ECM, and adaptive array antenna processing. N.W.

MICROCHANNEL SPATIAL LIGHT MODULATOR

Cardinal Warde *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 291-298 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

The Microchannel Spatial Light Modulator (MSLM), a versatile, highly sensitive, and optically addressed device being developed for real time optical information processing is discussed. The MSLM operates by converting an input optical image into a charge distribution at the surface of an electro-optic crystal. The charge distribution generates an electric field which modulates the refractive index of the crystal and thereby the phase or intensity of an image readout beam. Prototype devices employing 250 micron thick crystals exhibited a spatial resolution of 5 cycles/mm at 50% contrast, an exposure sensitivity of 2.2 nJ/cu cm and framing rates of 40 Hz with full modulation depth. The image processing operations that have been achieved using the internal processing mode of the MSLM include contrast reversal, contrast enhancement, edge enhancement, image addition and subtraction, analog and digital intensity thresholding, and binary level logic operations such as AND, OR, EXCLUSIVE OR, and NOR. N.W.

INFRARED FIBER OPTIC FOCAL PLANE DISPERSERS

John H. Goebel *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 301-308 refs (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Far infrared transmissive fiber optics as a component in the design of integrated far infrared focal plane array utilization is discussed. A tightly packed bundle of fibers is placed at the focal plane, where an array of infrared detectors would normally reside, and then fanned out in two or three dimensions to individual detectors. Subsequently, the detectors are multiplexed by cryogenic electronics for relay of the data. A second possible application is frequency up-conversion (v sub 1 + v sub 2 = v sub 3), which takes advantage of the nonlinear optical index of refraction of certain infrared transmissive materials in fiber form. Again, a fiber bundle is utilized as above, but now a laser of frequency v sub 1 is mixed with the incoming radiation of frequency v sub 1 within the nonlinear fiber material. The sum, v sub 2 is then detected by near infrared or visible detectors which are more sensitive than those available at v sub 2. Due to the geometrical size limitations of detectors such as photomultipliers, the focal plane dispersal technique is advantageous for imaging up-conversion. N.W.

E-BEAM GENERATED HOLOGRAPHIC MASKS FOR

OPTICAL VECTOR-MATRIX MULTIPLICATION
Steven M. Arnold and Steven K. Case (Minnesota Univ., Minneapolis) *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 309-317 (For primary document see N82-15894 06-74)
(Contract F49620-80-C-0029)
Avail: NTIS HC A15/MF A01 CSCL 20F

An optical vector matrix multiplication scheme that encodes the matrix elements as a holographic mask consisting of linear diffraction gratings is proposed. The binary, chrome on glass masks are fabricated by e-beam lithography. This approach results in a fairly simple optical system that promises both large numerical range and high accuracy. A partitioned computer generated hologram mask was fabricated and tested. This hologram was diagonally separated outputs, compact facets and symmetry about the axis. The resultant diffraction pattern at the output plane is shown. Since the grating fringes are written at 45 deg relative to the facet boundaries, the many on-axis sidelobes from each output are seen to be diagonally separated from the adjecent output signals. N.W.

MULTIFACET HOLOGRAPHIC OPTICAL ELEMENTS
Steven K. Case and Paul R. Haugen *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 319-325 refs (For primary document see N82-15894 06-74)
(Grant DAA29-81-K-0033)
Avail: NTIS HC A15/MF A01 CSCL 20F

New types of holographic optical elements, combining the flexibility of computer generated holograms with the large space bandwidth product and high diffraction efficiency of interferometrically recorded volume phase holograms, are demonstrated. The optical elements are recorded by subdividing a volume hologram film surface into numerous small areas (facets), each of which is individually exposed under computer control. Each facet is used to produce a portion of the desired final wavefront. Three different optical elements are demonstrated. N.W.

Avail: NTIS HC A15/MF A01 CSCL 20F

Creation of an electronically controlled liquid crystal lens for use as a focusing mechanism in a multi-element lens system or as an adaptive optical element is analyzed. Varying the index of refraction is shown to be equivalent to the shaping of a solid refracting material. Basic characteristics of liquid crystals, essential for the creation of a lens, are reviewed. The required variation of index of refraction is provided by choosing appropriate electrode voltages. The configuration required for any incoming polarization is given and its theoretical performance in terms of modulation transfer function derived. N.W.

MANIPULATION OF LIGHT WITH MAGNETO-OPTIC STRIPE DOMAIN FIELDS
E. J. Torok, F. G. Hewitt, J. A. Drawczak, and G. L. Nelson *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 341-350 refs Sponsored in part by Army Research Office (For primary document see N82-15894 06-74)
Avail: NTIS HC A15/MF A01 CSCL 20F

Magnetic diffraction grating materials, being developed to provide a simple means of deflecting light in a two dimensional, solid state fashion are discussed. The most promising material, for several applications, appears to be bismuth substituted iron garnet films in epitaxial form. Calculations indicate that deflection efficiency greater than 60% is possible in the near infrared region of the spectrum. Within the field of view of the deflector, measurements predict that 105 resolvable spots can be expected. Applications include: (1) general purpose deflection of free laser light, (2) image processing of extended sources such as transparencies, (3) programmable lensing, and (4) fiber optic matrix switching. INVESTIGATION OF A COHERENT OPTICAL METHOD FOR ROUGHNESS MEASUREMENTS Final Report, Dec. 1979
Norbert Rau Bonn Bundesministerium fuer Forschung und Technologie Feb. 1981 58 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-065 ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fehinformationszentrum, Karlruhe, West Germany DM 12.20

When a surface is illuminated with coherent or partial coherent light, the reflected light shows a structure in the intensity distribution. There are defined statistical quantities dependent on the surface roughness and surface properties. Computing models were constructed to describe the correlation between the speckle pattern and the roughness. The sum of the experimental examinations is to form a dependence of the statistical quantities in the speckle pattern on the surface so that a characteristic line for the determination of the roughness can be determined. Several light sources with different coherent properties were inserted and various technical surfaces were investigated. T.M.

By using specific process modifications, different sources of degradation were seperately investigated and analyzed. The investigations were carried out using GaP as a test vehicle and were later extended to other LED materials. A new degradation mechanism was discovered. Two procedures for an automatic mounting technique were developed. The simultaneous mounting technique allows a reduction of mounting time by a factor of 4. Using the one side mounting technique the wire bond processes can be omitted. A selective liquid phase epitaxy process for small area infrared emitters was developed, which makes it possible to grow GaAs layers on small isolated areas. Using a flip chip technique with the p-layer facing downwards, one side contacted monolithic 50 element arrays on transparent substrates (GaP) were developed in the colors green and orange. These arrays exhibit extremely low crosstalk. T.M.

(BMFT-FB-T-81-121; ISSN-0340-7608) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 9.90

A large range of thermoplastics with differing optical qualities is required for the calculation of new plastic lenses. Commonly-known general correlations between structure and refractive value, as well as pre-testing of over 300 compounds formed the basis for a selection of 3 product groups for optimisation. The iterative improvements made to these materials through experimental injection molding and by measuring further physical material ratings led to: a thermoplastic with n greater than 1.6; 4 thermoplastics with optical data between those of PMMA and PS or PC; and material which combines a low refractive value with relatively high optical dispersion. HIGH RESOLUTION X-RAY IMAGER Final Report

Hans Hartmann and Peter Predehl Bonn Bundesministerium fuer Forschung und Technologie Oct. 1981 82 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-042; ISSN-0170-1339) Avail: NTIS HC A05/MF A01

A laboratory model of a high resolution X-ray imaging detector was developed and constructed. The detector is suitable as a focal plane instrument for an X-ray telescope for astronomical observations. The detector will be used to test such telescopes in the laboratory. The X-ray photons are detected through photoconversion and secondary multiplication by two cascaded microchannel plates. Position determination is accomplished by means of a crossed grid charge collector. The operation of this detector as well as its development are described. The theory of charge division by a resistance-coupled wire grid is discussed in detail. A theory of the sensitivity of the detector for soft X-rays is developed and is in good agreement with measurements. M.G.

The visibility ranges 'maximum detection range' and 'maximum recognition range' were determined when observing air to ground. Both a 1.5 t truck and a Leopard 1 battle tank were used as land targets. The determination of observation values and the measurements of environmental parameters were carried out from helicopter Bell UH 1D. On the basis of the results obtained during these field tests, the influence of the following parameters on visibility ranges is shown: degree of turbidity of the atmosphere, background, illumination, direction of observation, flight altitude, environmental brightness (as environmental parameters); dimension of target, movement of target (as target parameters); and naked eye, field-glasses, light-intensifier, limitation of field of view (as observation parameters). The Kirkpatrick-Baez microscopes are decribed along with their role as the workhorse of the X-ray imaging devices. This role is being extended with the development of a 22X magnification Kirkpatrick-Baez X-ray microscope with multilayer X-ray mirrors. These mirrors can operate at large angles, high X-ray energies, and have a narrow well defined X-ray energy bandpass. Where a large solid angle is needed, the Woelter microscope will still be necessary and the technology needed to build them will be useful for many other typs of X-ray optics. DOE

A PLZT electrooptic filter being used to control the intensity of light transmitted to a video camera from samples undergoing pulsed electron beam thermal testing is discussed. This electron beam test system is part of a materials development program for fusion energy applications. During the testing, sample surface temperatures may reach 3000 C and the intense light from these pulses is potentially damaging to the camera. The use of a variable density electrooptic filter prevents this damage and provides improved image quality during rapid changes of surface temperature. DOE

(DE81-029316; BNL-29923; CONF-8106150-1) Avail: NTIS HC A02/MF A01

In order to exploit the high event rates at ISABELLE, it is necessary to have fast detection with fine spatial resolution. A prototype fine-grained hodoscope, the elements of which are scintillating optical fibers, is currently being constructed. The fibers were drawn from commercially available plastic scintillator which has been clad with a thin layer of silicone. It was demonstrated with one mm diameter fibers that with a photo-detector at each end, the fibers are more than 99% efficient for lengths of about 60 cm. The readout will be accomplished either with small diameter photomultiplier tubes or avalanche photodiodes (APD) used either in the linear or Geiger mode. The program of fiber development and evaluation is described. The status of the APD as a readout element is discussed, and an optical encoding readout scheme is described for events of low multiplicity. DOE

TRANSPARENT GaAlAs LUMINESCENT DIODES FOR OPTICAL WAVELENGTH MULTIPLEXING [TRANSPARENTE GaAlAs-LUMINESZENZDIODEN FUER OPTISCHEN WELLENLAENGENMULTIPLEXBETRIEB]
W. Proebster Bonn Bundesministerium der Verteidigung 1979 69 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-79-18) Avail: NTIS HC A04/MF A01; DOK-ZENTBw, Bonn DM 30

Gallium aluminum arsenide light emitting diodes (LED) are evaluated. The emission wavelength is determined by the aluminum content of the active region. A multiplex transmitter unit was constructed, consisting of a GaInAs LED emitting at 1.06 microns and of a transparent GaAlAs LED. The long wavelength light signal of the GaINAs LED is coupled through the transparent GaAlAs LED into the transmission fiber by means of a short connection fiber. Since the transmission fiber is directly coupled to the GaAlAs LED, light signals of 0.8 microns and 1.06 microns are simultaneously transmitted. The light power in the transmission fiber and the modulation bandwiths of the LED's (200 Mhz for the GaInAs LED and 100 Mhz for the GaAlAs LED) allow for a high transmission capacity. Author (ESA)

THEORETICAL STUDY OF IMAGE SPOTS WITH THE WIDE FIELD CAMERA AND THE IMPLICATIONS FOR NEBULAR SPECTROGRAPHY [ETUDE THEORIQUE DES TACHES IMAGES DE LA CAMERA GRAND CHAMP ET DU SPECTROGRAPHE NEBULAIRE]
J. Y. LeGall Sep. 1981 46 p In FRENCH
(LAS-OPT.INST-03-81) Avail: NTIS HC A03/MF A01

A Schmidt camera onboard Spacelab is considered. The operating spectral domain (120 to 350 nm) necessitates an optical correction for differential aberrations in function of view angle. A computer program (CASSE-TETE) is adapted. Coefficients of asphericity for a deformed mirror are calculated. Test spectrographs were made for 66 deg field of view at various wavelengths. The program CASSE-TETE gives spot diagrams similar to mirror manufacturer ones. It is appropriate for determining the optimal position of the mirror where image spots are as small as possible. Author (ESA)

(Grant NsG-1323; Contracts DE-AC02-78ET-51013; DE-AS02-78ET-53076; N00014-77-C-0641; ET-78-C-02-4687; F49620-79-C-0200)
(NASA-CR-164804; DE81-029962; DOE/ET-51013/5; PFC/RR-81-3) Avail: NTIS HC A05/MF A01 CSCL 20I

The current state of the mechanics of the Constance II experiment, the physics results gathered, the motivation background, and future plans for the Constance II experiment are reviewed. Several improvements have been made and several experimental investigations have been completed. These include the construction/installation/testing of: (1) liquid-nitrogen cooled, Ioffe bars installed, (2) a diverter coil (3) the 100 kW ICRF generator, (4) the data acquisition system, and (5) the optimum hot-iron operation of the machine with Titanium and pulsed-gas plasma guns. Measurements were made of the density, temperature, and radius of the plasma. Ion-cyclotron fluctuations were observed, their bandwidth measured, and data collected demonstrating resonance heating. New X-ray diagnostics were designed and purchased, and progress on the Thomson scattering was made. Finally, a new hot cathode gun was designed and constructed. M.D.K.

EQUILIBRIUM AND STABILITY OF EXPERIMENTAL HIGH BETA TOROIDAL PLASMAS

S. C. Prager 1981 12 p Presented at the 23rd Ann. Meeting of the Div. of Plasma Phys. of the APS, New York, N.Y., 12-16 Oct. 1981
(Contract DE-AS02-78ET-53051)
(DE81-023610; DOE/ET-53051/24; CONF-811028) Avail: NTIS HC A02/MF A01

The beta limit to the stability of average minimum-beta plasmas remains unknown for all such confinement concepts. The strength of nonMHD effects was demonstrated in a study of the equilibrium and stability properties of high beta plasmas. A wide range of stable high beta plasmas were created from beta = approximately 8% to 35%, 2 to 9 times the single fluid ballooning instability beta limit of 4%. No beta related fluctuations were observed in magnetic field, density, or electrostatic potential. Since the critical parameter for instability onset is diamagnetic current density, not beta, the observed stability at beta = 35% may be understandable. Measurements are underway to detect the equilibrium Pfirsch-Schlueter current that flows parallel to the magnetic field. The injection of 3.8 MW of auxiliary heating (2 MW ion cyclotron heating and 1.8 MW neutral beam) to enlarge the high beta parameter space is in progress. DOE

BREAKDOWN IN THE PRETEXT TOKAMAK Ph.D. Thesis

Jay F. Benesch Jun. 1981 83 p refs
(Contract DE-AS05-77ET-53042)
(DE81-029362; DOE/ET-53042/2; FRCR-226) Avail: NTIS HC A05/MF A01

Data are presented on the application of ion cyclotron resonance RF power to preionization in Tokamaks. A 0.3-3 kW at 12 MHz was applied to hydrogen and a visible discharge was obtained but no scaling of breakdown voltage was found with any parameter that was varied. A possible explanation for this, which implies that higher RF power would have been much more effective, is discussed. Finally, the investigation of the dV/dt dependence of breakdown voltage in PRETEXT, a phenomenon also seen in JFT-2 is presented. The breakdown is discussed in terms of the physics of Townsend discharges. DOE

NONLINEAR STEADY-STATE COUPLING OF LH WAVES

K. Ko and V. B. Krapchev Feb. 1981 8 p refs Presented at the 4th Topical Conf. on Radio Frequency Plasma Heating, Austin, Tex., 9 Feb. 1981
(Contract DE-AC02-78ET-51013)
(DE81-029435; DOE/ET-51013/11; PFC/RR-81-9; CONF-810214-9) Avail: NTIS HC A02/MF A01

The coupling of lower hybrid waves at the plasma edge by a two waveguide array with self-consistent density modulation is solved numerically. For a linear density profile, the governing nonlinear Klein-Gordon equation for the electric field can be written as a system of nonlinearly modified Airy equations in Fourier k sub z space. Numerical solutions to the nonlinear system satisfying radiation condition are obtained. Spectra broadening and modifications to resonance cone trajectories are observed with increase of incident power. DOE

LH WAVE ABSORPTION BY MODE CONVERSION NEAR ION CYCLOTRON HARMONICS

K. Ko, A. Bers (REQ, Varennes, Quebec), and V. Fuchs Feb. 1981 8 p refs Presented at the 4th Topical Conf. on Radio Frequency Plasma Meeting, Austin, Tex., 9 Feb. 1981
(Contract DE-AC02-78ET-51013)
(DE81-029434; DOE/ET-51013/10; CONF-810214-8; PFC/RR-81-8) Avail: NTIS HC A02/MF A01

Numerical studies of the dispersion relation near the lower hybrid frequency in an inhomogeneous plasma (delta n, delta T, delta B) show that portions of an incident lower hybrid wave spectrum undergo successive but partial mode conversions to warm plasma waves in the presence of ion cyclotron harmonics. Wave absorption beyond the first mode conversion occurs near an ion cyclotron harmonic where ion Landau damping is enhanced. A second order dispersion relation numerically in good agreement with the full dispersion relation in the mode conversion region is derived using the condition variation in D/variation in k = 0. The mode conversion efficiency at each confluence is evaluated by solving the corresponding differential equation. DOE

DESIGN OF 24.8-KW, 3.8 K CRYOGENIC SYSTEM FOR ISABELLE

D. P. Brown, M. Afrashteh, J. A. Bamberger, A. Fresco, A. P. Schlafke, W. J. Schneider, J. Sondericker, A. Werner, and K. C. Wu 1981 6 p refs Presented at the Cryogenic Eng. Conf., San Diego, Calif., 10-14 Aug. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030555; BNL-30013; CONF-810835-20) Avail: NTIS HC A02/MF A01

ISABELLE will consist of two proton accelerator/storage rings in a common tunnel. There will be 1084 superconducting magnets installed in the 3.8 km circumference tunnel. The protons will be accelerated to an energy of 400 GeV in each ring and stored for 24 hours. The two beams are counter-rotating and intersect at six places around the ring. The particles which emerge from proton interactions at these intersecting points are studied using various types of detectors. DOE

THERMAL CONDUCTIVITY MEASUREMENTS OF INSULATORS FOR FUSION BLANKETS

F. L. Horn, J. A. Fillo, and J. R. Powell 1981 5 p refs Presented at the Fusion Reactor Mater. Meeting, Seattle, 9 Aug. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030028; BNL-29779; CONF-810831-50) Avail: NTIS HC A02/MF A01

Alumina-silica mat (6 lb/cu ft) varied in thermal conductivity in air and Ar from 0.06 W/m- K at 300 C to 0.22 W/m- K at 1000 C, but in He it increased to 0.24 W/m- K at 300 C and 0.54 W/m- K at 1000 C, while in steam it was about midway between these values. The carbon and graphite felts behaved similarly, but the rigid and denser (24 lb/cu ft) zirconia fiberboard exhibited superior insulating properties: 0.07 W/m- K at 300 C and 0.14 W/m- K at 1000 C in air and Ar, and 0.13 W/m- K at 300 C and 0.17 W/m- K at 1000 C in steam, but rising to 0.15 W/m- K at 300 C and 0.49 W/m- K at 1000 C in He. The lighter zirconia felt (14 lb/cu ft) in steam at 1000 C was thought to be best at 0.23 W/m- K and only 0.40 W/m- K in He at 1000 C. DOE

ALGORITHMS DEVELOPED TO OBTAIN PARTICULAR NUMERICAL SOLUTIONS TO THE IDEAL MHD EQUILIBRIUM PROBLEM

T. S. Wang and F. J. Helton Jul. 1981 31 p refs Presented at the European Workshop on the Behavior of Magnetically-Confined Plasma, Wildhaus, Switzerland, 9 Sep. 1981 Submitted for publication
(Contract DE-AT03-76eT-51011)
(DE81-029891; GA-A-16400; CONF-810947-3) Avail: NTIS HC A03/MF A01

The determination of axially symmetric magnetohydrodynamic (MHD) equilibria with free plasma-vacuum interface requires the solution of a two dimensional, elliptic, nonlinear partial differential equation. The shape of the boundary is not specified but is determined as the nonlinear response nor uniqueness of solution is quaranteed for this nonlinear elliptic free-boundary problem. In this paper we discuss algorithms developed to obtain particular numerical solution to the MHD equilibrium problem. These algorithms have been divided into two categories, those involving current initialization and those involving feedback stabilization. DOE

CURRENT DRIVEN NONIDEAL INSTABILITY IN A FORCE-FREE TOROIDAL PLASMA

M. S. Chu, F. J. Helton, J. K. Lee, R. W. Moore, J. M. Greene, and T. H. Jensen Jul. 1981 27 p refs Presented at the

European Workshop on the Behavior of Magnetically-Confined Plasmas, Wildhaus, Switzerland, 9 Sep. 1981
(Contract DE-AT03-76ET-51011)
(DE81-029892; GA-A-16418; CONF-810947-2) Avail: NTIS HC A03/MF A01

The problem of the current-driven linear instability of a general force free equilibrium has been formulated in terms of a variational problem with the vector potential as the trial function. The formalism allows A x B sub 0 not equal to 0 so that nonideal effects are modeled. The variational problem studied numerically for both infinite aspect ratio and finite aspect ratio Tokamaks. Results of these numerical studies are presented.

GATO: AN MHD STABILITY CODE FOR AXISYMMETRIC PLASMAS WITH INTERNAL SEPARATRICES
L. C. Bernard, F. J. Helton, and R. W. Moore Jul. 1981 19 p refs Presented at the European Workshop on the Behavior of Magnetically-Confined Plasmas, Wildhaus, Switzerland, 9 Sep. 1981 Submitted for publication
(Contract DE-AT03-76ET-51011)
(DE81-029889; GA-A-16441; CONF-810947-1) Avail: NTIS HC A02/MF A01

The GATO code computes the growth rate of ideal magnetohydrodynamic instabilities in axisymmetric geometries with internal separatrices such as doublet and expanded spheromak. The basic method, which uses a variational principle and a Galerkin procedure to obtain a matrix eigenvalue problem, is common to the ERATO and PEST codes. A new coordinate system has been developed to handle the internal separatrix. Efficient algorithms have been developed to solve the matrix eigenvalue problem for matrices of rank as large as 40,000. Further improvement is expected using graph theoretical techniques to reorder the matrices. Using judicious mesh repartition, the marginal point can be determined with great precision. The code has been extensively used to optimize doublet and general Tokamak plasmas. DOE

AN ESTIMATE OF CONVECTION COOLING IN THE BOUNDARY LAYER OF TOROIDAL FUSION PLASMAS
G. H. Wolf Jul. 1980 18 p refs In GERMAN; ENGLISH summary
(Juel-1666; ISSN-0366-0885) Avail: NTIS HC A02/MF A01

By means of a simple model, the boundary layer plasma temperature T in toroidal fusion plasmas was estimated, supposing that the heating power transmitted to a toroidally confined plasma is eventually carried away by convective plasma flow in the boundary layer. The value of T is critical as regards plasma-wall interaction and heat loading of limiters and divertors. The boundary layer of thickness delta fills the interspace between the outermost closed magnetic surface and the first wall which encloses the plasma column toroidally. The model requires that delta is equal to or larger than (10 exp 15)/n cm, n being the average boundary plasma density. The model connects the total heating power with average values of the plasma parameters T and n in the boundary layer and of the angle epsilon which gives the direction of the plasma flow towards the wall. The values of epsilon and delta can be controlled by the field configuration of the magnetic limiter. This results in an estimate of T in front of the first wall (for epsilon xn = 10 exp 12 cm exp (-3) and using the parameters of the Tokamaks Textor and Intot, T is on the order of 10 eV or lower). A COMPILATION OF RAYLEIGH CROSS SECTIONS FOR THE LASER DIAGNOSTICS OF PLASMAS
K. Hirsch Oct. 1980 28 p refs In GERMAN; ENGLISH summary
(IPF-80-10) Avail: NTIS HC A03/MF A01

Fundamental notions of scattering, polarization, and cross sections were reviewed. The experimental scattering and detection set-up is described. Rayleigh data for nine gases were derived which are in excellent agreement with theoretical calculations. Together with established data from the literature, these results are compiled in tables and graphs of differential and total cross sections, ratio of Thomson to Rayleigh cross sections, and equivalent electron density. ENERGY ANALYSIS OF FAST IONS FROM PLASMA FOCUS DISCHARGES
A. Mozer Sep. 1980 120 p refs In GERMAN; ENGLISH summary
(IPF-80-11) Avail: NTIS HC A06/MF A01

A Thomson parabola spectrometer was developed and used for energy and mass analysis of the fast ions emitted by a plasma focus. The design of the spectrometer, the detection system using cellulose nitrate films error analysis, and the calibration and test procedure are described. Besides deuterons, results reveal the presence in the emitted flux of highly ionized impurity ions which attain energies up to 18 MeV. Their energy distribution is consistent with acceleration in an electric field reaching 4 MV/mm. The deuteron distribution is shown to depend on the filling pressure. Besides use as an intense neutron source, the plasma focus can be used as a heavy ion accelerator provided the heavy ion yield can be increased. Author (ESA)

RELATION BETWEEN NEUTRON PRODUCTION AND INSTABILITIES IN A PLASMA FOCUS [UEBER DEN ZUSAMMENHANG ZWISCHEN NEUTRONENPRODUKTION UND INSTABILITAETEN AM PLASMAFOKUS]
B. Rueckle Jan. 1981 100 p refs In GERMAN
(IPF-81-1) Avail: NTIS HC A05/MF A01

The macroscopically recognizable circumstances and requirements for a strong neutron emission from a plasma focus were experimentally studied. It was necessary to simultaneously employ many diagnostic techniques with high space and time resolution. A ten channel N2 laser interferometer was developed for the investigation of plasma density is described. Magnetic probes and scintillator multipliers were also used. Neutron and X-ray emissions are connected with the m = o (m = azimuthal periodicity) pinch instabilities at the end of the discharge. The relation of neutron production to the m = o instability is examined. Detail observations show that neutron production is most probably due to a beam-target mechanism. Due to microinstabilities, the plasma resistance is abnormally high during reexpansion after m = o instabilities and concomitant deuteron production is observed.

An open-tube, sliding-boat, liquid-phase system has been used to grow ZnxCd(1-x)SnP2 epitaxially on InP substrates. X-ray diffraction measurements indicate that this alloy grows on (100) substrates with the lattice-matched a-axis in the growth plane and the c-axis in the growth direction. Unintentionally-doped layers have electron concentrations as high as 3 time 10 to the -19th power cu cm with mobility values of about 2,000 sq cm/V sec. These mobility values are substantially larger than have been obtained in the equivalent III-V materials at similar concentrations. Attempts to grow ZnGeAs2 epitaxially on GaAs substrates with a Zn-Ge-AsCl3 and a Zn-GeCl4-Ge-As4 vapor-phase system have met with little success. Although the first system gives good control over the As flux and the second over Ge, reproducible results have not been achieved in either system. Our experience with these methods, however, indicates that most of the reproducibility problems can be overcome with a Zn-GeCl4-AsCl3 reactor. We are currently investigating this method. Calculations are presented on the I-V characteristics of a space-charge limited diode. If the electrons exhibit inertial motion (are not scattered), then they will quickly reach nonparabolic regions of the conduction band. When this nonparabolicity is taken into account, the current appears ohmic rather than exhibiting a V to the 3/2 power behavior, as has been previously supposed. GRA

IMPURITY AND DEFECT INTERACTIONS IN GaAs Annual Technical Report, 1 Aug. 1980 - 31 Jul. 1981

C. M. Wolfe, P. A. Fedders, G. E. Stillman, Camellia M. L. Yee, and R. T. Green 30 Sep. 1981 50 p refs
(Contract N00014-80-C-0762; RR0210203)
(AD-A106106; Rept-64422-1) Avail: NTIS HC A03/MF A01 CSCL 20/2

The construction of an epitaxial reactor to examine the basic aspects of complex formation in GaAs has been completed. This reactor is designed to simultaneously dope the growing layer with a donor impurity and Cr and/or O so that impurity interaction regions are obtained in the same sample. We are currently calibrating this system for several dopants. The redistribution of Cr during the annealing of uniform and ion-implanted bulk samples has been examined. Preliminary results indicate that the Cr build-up at the surface can be modified by applying an electric field to the surface during the annealing process. With the availability of high-purity GaAs from a variety of epitaxial growth techniques, improved donor identifications have been made by far infrared photoconductivity measurements. Samples grown by AsCl3-H2 VPE, AsCl3-N2 VPE, AsH3 VPE, LPE, MBE, and MOCVD have been examined and the common residual donors have been identified. GRA

PREPARATION AND MOLECULAR AND CRYSTAL STRUCTURE OF TRANS-R.S.-(Cr(2, 3, 2-TET)(NCS)2) NCS

Helmut R. Maeecke, Bernard F. Mentzen, Jean Pierre Puax, and Arthur W. Adamson 17 Sep. 1981 33 p refs Submitted for publication
(Contract N00014-76-C-0548; NR Proj. 051-601)
(AD-A105595; TR-17) Avail: NTIS HC A03/MF A01 CSCL 07/3

The complex Cr(2,3,2-tet)(NCS)2 NCS was prepared by a route expected to yield the cis form, namely by stereoretentive substitution of thiocyanate for chloride in cis-Cr(2,3,2-tet) Cl2(+). Crystal structure determination shows however, that it is the trans-isomer that actually is obtained. The structure determination was by X-ray single crystal analysis. The thiocyanate complex crystallizes in the monoclinic p sub 2 lc space group with a = 8.153 (2), b = 15.556 (2), and c = 14.175 (2) a, and dot beta = 99.84 (2). There are four formula units per unit cell. The structure was solved by the heavy-atom method, and full-matrix least squares refinement led to a final value of the R(R sub w) index of 0.0295 (0.0332) based on 2380 unique reflectors. The chromium atom is hexacoordinated and the six nitrogen atoms form a slightly distorted octahedron with a nearly planar CrN4 unit. The use of visible and infrared spectroscopy for isomer identification is discussed for the case of thiocyanate containing metal amine complexes. GRA

A STUDY OF THE UNIPOLAR ARCING DAMAGE MECHANISM ON SELECTED CONDUCTORS AND SEMICONDUCTORS M.S. Thesis

Franklin Terrence Ryan and Stephen Tucker Shedd Jun. 1981 125 p refs
(AD-A105791) Avail: NTIS HC A06/MF A01 CSCL 20/12

A broad investigation, experimental and theoretical, of the mechanism of unipolar arcing has been conducted. A theoretical discussion of existing unipolar arc models is presented. Experimental and theoretical evidence is used to support the Schwirzke-Taylor Model at the expense of other models. Three current models of arc motion are examined and refuted. Experimental results show that Aluminum and various steels arc heavily, Molybdenum and Nickel to a lesser extent, and commercially prepared metallic glasses not at all. The semi-conductors showed some arcing on Germanium but none on Silicon. Experiments showed that grain boundaries play no significant role in unipolar arc initiation. Experiments were conducted in which a laser produced metallic glass is exposed to the plasma produced by the same laser pulse. The results are used to refute the microwhisker explosion models of unipolar arc initiation. GRA

SMALL-ANGLE X-RAY SCATTERING SYSTEM WITH LINEAR POSITION-SENSITIVE DETECTOR

A. R. Forouhi, B. Sleaford, V. Perez-Mendez, D. deFontaine, and J. R. Fordor (Spectrolabs, Inc., Sylmar, Calif.) Apr. 1981 11 p refs Presented at the IEEE Symp. on Nucl. Sci., San Francisco, 21-23 Oct. 1981
(Contract W-7405-eng-48; Grant NSF DMR-79-20405)
(DE81-021920; LBL-12587; CONF-811012-1) Avail: NTIS HC A02/MF A01

A linear position-sensitive detector has been constructed for use in small-angle X-ray scattering experiments. It is a one dimensional, pressurized gas-filled detector with a delay line read out. Calculated efficiency of the detector at 8.04 keV and 45 psi for ArCH4 filling is 60%, and for Xe-CO2 filling is 90% limited only by the thickness of the entrance beryllium window. Inherent reslution of the detector is 0.1 mm for normal incident X-rays. The overall resolution of the detection system is determined by the width and angular divergencies of the point collimated CU K/sub alpha/ beam used in the experiment. The performance of the system is described in terms of measurements on Al-Zn alloy samples. DOE

EFFECTS OF REAGENT TRANSLATIONAL AND VIBRATIONAL ENERGY ON THE DYNAMICS OF ENDOTHERMIC REACTIONS

D. Krajinovich, Z. Zhang, F. Huisken, Y. R. Shen, and Y. T. Lee Jul. 1981 15 p refs Presented at the 12th IPEAC Intern. Conf. on the Phys. of Electron. and Atomic Collisions, Gatlingburg, Tenn., 15-22 Jul. 1981

(Contract W-7405-eng-48)
(DE81-028122; LBL-12982; CONF-810754-1) Avail: NTIS HC A02/MF A01

The endothermic reactions Br + CH3I yields CH3 + IBr (delta H sub zero = 13 kcal/mole) and Br + CF3I yields CF3 + IBr (delta H sub zero = 11 kcal/mole) were studied by the crossed molecular beams method. Detailed center of mass contour maps of the IBr product flux as a function of recoil velocity and scattering angle are derived. For both systems it is found that the IBr product is sharply backward scattered with respect to the incident Br direction, and that most of the available energy goes into product translation. Vibrational enhancement of the Br + CF3I reaction was investigated by using the infrared multiphoton absorption process to prepare highly vibrationally excited CF3I. At a collision energy of 31 kcal/mole (several times the barrier height), reagent vibrational energy appears to be less effective than an equivalent amount of (additional) translational energy in promoting reaction. More forward scattered IBr is produced in reactions of Br with vibrationally hot CF3I.

INTEGRAL-CAPTURE MEASUREMENTS AND CROSS-SECTION ADJUSTMENTS FOR Nd, Sm, AND Eu
R. A. Anderl, F. Schmittroth (Hanford Engineering Development Lab.), and Y. D. Harker Jul. 1981 113 p refs
(Contract DE-AC07-76ID-01570)
(DE81-029635; EGG-PHYS-5182) Avail: NTIS HC A06/MF A01

Integral capture reaction rates are reported for Nd 143, Nd 144, Nd 145, Sm 147, Eu 151, Eu 152, Eu 153 and Eu 154 irradiated in different neutron spectra in EBR. These reaction rates are based primarily on mass spectrometric measurements of the isotopic atom ratios of the capture product to the target nuclide. The neutron spectra are characterized using passive neutron dosimetry and spectrum unfolding with the FERRET least squares data analysis code. Reaction rates for the neutron spectrum monitors were determined by the radiometric technique using Ge(Li) spectrometers. The integral data for the rare earth samples and for the spectrum monitors were used in multi-group flux/cross sections adjustment analyses with FERRET to generate adjustments to 47 group representations of the ENDF/B-IV capture cross sections for the rare earth isotopes.

A. S. Schlachter Jun. 1981 27 p refs Presented at the Joint Workshop on Negative Ions, Mexico City, 1-4 Apr. 1981
(Contract W-7405-eng-48; Grant NATO-172.80)
(DE81-028134; LBL-12985; CONF-810442-4) Avail: NTIS HC A03/MF A01

Experimental studies of D(-) collisions are of interest for basic physics, where experimental results can be used to test theoretical models for charge transfer, and for applications to ion sources for accelerators and for heating magnetically confined plasmas of interest for fusion. The high D(-) yield from charge transfer in a thick cesium-vapor target is consistent with recent cross section calculations and measurments. Recent theoretical calculations of cross sections in thick alkaline earth vapor targets, leading to prediction of a large D(-) yield at low energy, have been partially confirmed in recent measurments, in which a D(-) yield of 50% was observed at a D energy of 500 eV.

ELECTRICAL PROPERTY STUDIES OF OXYGEN IN CZOCHRALSKI-GROWN NEUTRON-TRANSMUTATION-DOPED SILICON
J. W. Cleland and N. Fukuoka (Osaka Univ., Japan) Oct. 1980 30 p refs Presented at the 3rd Intern. Conf. on NTD-Silicon, Copenhagen, 27 Aug. 1980
(Contract W-7405-eng-26)
(DE81-028143; CONF-800877-3) Avail: NTIS HC A03/MF A01

Electrically active oxygen-related donors can be formed in Czochralski (Cz) Si either during crystal growth or during subsequent heat treatment. The carrier concentration of Cz and neutron transmutation doping (NTD) Cz Si samples was determined as a function of the initial dopant, oxygen, and P concentration before and after isothermal or isochronal annealing. Low temperature 350 C to 500 C heat treatment can introduce a significant oxygen donor concentration in Cz Si and in NTD Cz Si that contains radiation-induced lattice defects. Intermediate temperature (550 C to 750 C) heat treatment to remove oxygen donors or lattice defects, can introduce other oxygen donors. Extended (20 h) high-temperature 1000 C to 1200 C annealing can remove oxygen donors and lattice defects. Results suggest that oxygen-related donor formation in NTD Cz Si at temperatures below 750 C may serve to mask any annealing study of lattice defects. Annealing for 30 min at 750 C is sufficient to remove radiation damage in NTD Cz Si when the separate effects of oxygen donor formation are included.

RECENT ADVANCES IN THE STUDY OF STRUCTURAL PHASE TRANSISTORS AT HIGH PRESSURE
G. A. Samara 1981 8 p refs Presented at the Conf. on High Pressure Phys., Bad Honnef, W. Germany, Aug. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030206; SAND-81-1151C; CONF-810828-6) Avail: NTIS HC A02/MF A01

The role of pressure in the study and understanding of some structural phase transitions in solids is discussed. Results on a number of crystals exhibiting displative, order-disorder and cooperative Jahn-Teler transitions are presented. The occurrence of each type of these transitions is determined by a balance between competing interactions, and pressure alters this balance and allows tests of our understanding of the physical phenomena involved. Some emphasis is on displacive transitions especially with regard to incommensurate structures and the behavior near the so called displacive limit. This limit is the special case where the transition temperature T/sub c/ = 0 K. As T/sub C/ decreases and approaches 0 K quantum effects can be expected to come into play. Pressure turns out to be an excellent variable to study the crossover from classical to quantum behavior expected on approaching the displacive limit.

SLOW POSITRONS IN THE STUDY OF SURFACE AND

NEAR-SURFACE DEFECTS
K. G. Lynn 1981 54 p refs Presented at the Intern. School of Phys. Position in Solids Conf., Lake Como, Italy, 14 Jul. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030027; BNL-29798; CONF-810756-1) Avail: NTIS HC A04/MF A01

A general theoretical model is presented which includes the probability of a positron diffusing back to the surface after implentation, and thermalization in samples containing various defects. This model incorporates surface state and thermal desorption from this state, as well as reflection back into the bulk. With this model vacancy formation enthalpies, activation energies of positrons from surface states, and specific trapping rates are deduced from the positronium fraction data. An amorphous Al/sub x/O/sub y/ overlayer on Al is discussed as an example of trapping in overlayers. In well-annealed single crystal samples, the positron is shown to be freely diffusing at low temperatures, whereas in a neutron-irradiatied Al single crystal sample the positron is localized at low positron binding energy defects presumably created during irradiation. GRAD: A TOOL FOR PROGRAM ANALYSIS AND PROGRESS MONITORING
Winifred W. S. Yen and J. Dennis Lawrence Jun. 1981 5 p refs Presented at the Ann. Meeting of the Geothermal Resources Council, Houston, Tex., 25-29 Oct. 1981
(Contract W-7405-eng-48)
(DE81-028098; LBL-12820; CONF-811015-14) Avail: NTIS HC A02/MF A01

The development and operation of the Geothermal Resource Areas Database (GRAD) is described. The data base was created as part of the National Geothermal Progress Monitor System in 1979. The data base is organized around the concept of a geothermal area and provides broad coverage of geothermal development activities in the United States. Sixteen records, covering pre-lease, lease, and post-lease activities are defined for each area. Data collected in the various subject areas are critically evaluated, and then entered into an on-line interactive computer system. The system is publicly available for retrieval and use. DOE

THE INFLUENCE OF AERONAUTICAL R&D EXPENDITURES UPON THE PRODUCTIVITY OF AIR TRANSPORTATION Final Report, 1926-1976
Ralph C. Lenz, John A. Machnic, and Anthony W. Elkins Jul. 1981 248 p refs
(Grant NSF SRS-79-10397)
(PB81-247140; UDR-TR-81-72; NSF/SIU-81-1) Avail: NTIS HC A11/MF A01 CSCL 05A

The impact which aeronautical R&D expenditures have had upon productivity growth in the air transportation industry over the 50-year period from 1926 to 1976 is examined. Quantitative analyses of the returns on U.S. investments in aeronautical R&D show that the net gains from such investments are very large in comparison with standard commercial opportunities during the same period. The gains were distributed primarily to the traveling public and, to a lesser extent, to the airline employees. Author

SOME TECHNICAL WRITING SKILLS INDUSTRY NEEDS
F. R. Smith *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 335-341 (For primary document see N82-15986 06-82)
Avail: NTIS HC A14/MF A01 CSCL 05B

It is suggested that engineers and other technical students be taught three classes of skills in technical writing. First, 'Big Picture Things', which includes: the importance of clear writing, the wide scope of writing, the wide scope of writing tasks that will be faced in industry, and the principles of organization of technical materials such as: how to analyze, classify, partition, and interpret. Second, 'Writing Procedures', which encompasses: how to get words on paper efficiently and team-write. Third, 'Writing Details', in which two considerations are important: how to achieve precision in the use of language and the aspects of style. Three problems in style are cited: the problem of sentence transition, overuse of attributive adjectives, and verbosity in paragraph structure. The most important thing in technical writing is considered to be functionality, economy and clarity. M.D.K.

N82-15988*# Communication Support Services, Inc., Bedford, Tex.
TECHNICAL WRITING VERSUS TECHNICAL WRITING
J. W. Dillingham *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 343-348 refs (For primary document see N82-15986 06-82)
Avail: NTIS HC A14/MF A01 CSCL 05B

Two terms, two job categories, 'technical writer' and 'technical author' are discussed in terms of industrial and business requirements and standards. A distinction between 'technical writing' and technical 'writing' is made. The term 'technical editor' is also considered. Problems inherent in the design of programs to prepare and train students for these jobs are discussed. A closer alliance between industry and academia is suggested as a means of preparing students with competent technical communication skills (especially writing and editing skills) and good technical skills. M.D.K.

WHYS AND HOWS OF IN-HOUSE WRITING
John C. Lane *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 349-354 (For primary document see N82-15986 06-82)
Avail: NTIS HC A14/MF A01 CSCL 05B

The combining of requisite technical knowledge with requisite writing ability is addressed. Considerations in the development of in-house writing courses, in-plant training, are presented and evaluated. Specific problems in past methodology are also detailed. It is suggested that teachers of technical writing should be technical people themselves, preferably with working experience in industry or business; the training provided should be user-oriented, not theory oriented. M.D.K.

N82-15990*# Ohio State Univ., Wooster. Agricultural Technical Inst.
TECHNICAL WRITING PRACTICALLY UNIFIED THROUGH INDUSTRY

Linda S. Houston *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 369-383 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

General background details in the development of a university level technical writing program, based upon the writing tasks of the student's occupations, are summarized. Objectives and methods for unifying the courses of study with the needs of industry are discussed. Four academic course divisions, Industries Technologies, in which preparation and training are offered are: Animal, Horticulture, Agriculture, and Agricultural Business. Occupational competence is cited as the main goal for these programs in which technical writing is to be practically unified through industry. Course descriptions are also provided. M.D.K.

N82-15991*# New Mexico State Univ., Las Cruces. Dept. of English.

THE COMPOSING PROCESS IN TECHNICAL COMMUNICATION

Roger E. Masse *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 387-399 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

The theory and application of the composing process in technical communications is addressed. The composing process of engineers, some implications for composing research for the teaching and research of technical communication, and an interpretation of the processes as creative experience are also discussed. Two areas of technical communications summarized concern: the rhetorical features of technical communications, and the theoretical background for a process-based view, a problem-solving approach to technical writing. M.D.K.

N82-15992*# Rensselaer Polytechnic Inst., Troy, N. Y. Dept. of Language, Literature, and Communication.

A CASE STUDY OF THE INFLUENCES OF AUDIENCE AND PURPOSE ON THE COMPOSING PROCESSES OF AN ENGINEER

Bonny J. Stalnaker *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 401-411 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

The design and preliminary findings of a study of composing processes (on the job) of engineers, managers, and scientists is presented. The influences of audience and purpose on the composing process of engineers was of concern; specifically, the cognitive processes, physical behaviors, and factors that influence the evoluton of a piece of writing. An overview of the study, related literature, outlines of research design, and preliminary findings from a case study of engineers are given. It is suggested that teaching be adapted to help students learn to represent rhetorical problems to guide composing for effective writing. M.D.K.

N82-15993*# University of Southern Illinois at Carbondale.

THE COMPOSING PROCESS IN TECHNICAL COMMUNICATIONS

Vivienne Lucas Hertz *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 423-433 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

The theoretical construct under which technical writing exercises operate and results from a survey distributed to a random sample of teachers of technical writing are described. The survey, part of a study to develop materials that did not stress prescriptive formats, drew on diverse elements in report writing to enhance writing as a process. Areas of agreement and disagreement related to problem solving, paper evaluation, and individualizing instruction were surveyed. Areas of concern in contemplating the composition process include: (1) the need to create an environment that helps students want to succeed, (2) the role of peer group activity in helping some students who might not respond through lecture or individual study, and (3) encouraging growth in abilities and helping motivate students' interest in writing projects through relevant assignments or simulations students perceive as relevant. N.W.

N82-15994*# Iowa State Univ. of Science and Technology, Ames.

USING SENTENCE COMBINING IN TECHNICAL WRITING CLASSES

M. Rosner and T. Paul *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 527-534 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

Sentence combining exercises are advanced as a way to teach technical writing style without reliance upon abstractions, from which students do not learn. Such exercises: (1) give students regular writing practice; (2) teach the logic of sentence structure, sentence editing, and punctuation; (3) paragraph development and organization; and (4) rhetorical stance. Typical sentence, paragraph, and discourse level sentence combining exercises are described. N.W.

N82-15995*# Rensselaer Polytechnic Inst., Troy, N. Y.

TEACHING AUDIENCE ANALYSIS TO THE TECHNICAL STUDENT

M. B. Debs and L. V. Brillhart (Triton Coll., River Grove, Ill.) *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 537-542 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

Teaching audience analysis, as practiced in a technical writing course for engineering students, is discussed. Audience analysis is described as the task of defining the audience for a particular piece of writing and determining those characteristics of the audience which constrain the writer and effect reception of the message. A mature technical writing style that shows the tension produced when a text is written to be read and understood is considered in terms of audience analysis. Techniques include: (1) conveying to students the concept that a reader with certain expectations exist, (2) team teaching to preserve the context of a given technical discipline, and (3) assigning a technical report that addresses a variety of readers, thus establishing the complexity of audience oriented writing. N.W.

N82-15996*# Oklahoma Univ., Norman.

THE COMPOSING PROCESS OF TECHNICAL WRITERS: A PRELIMINARY STUDY

David Mair and Nancy Roundy (Iowa State Univ. of Science and Technology) *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 543-549 (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

The assumption that technical writers compose as do other writers is tested. The literature on the composing process, not limited to the pure or applied sciences, was reviewed, yielding three areas of general agreement. The composing process (1) consists of several stages, (2) is reflexive, and (3) may be mastered by means of strategies. Data on the ways technical writers compose were collected, and findings were related to the three areas of agreement. Questionnaires and interviews surveying 70 writers were used. The disciplines represented by these writers included civil, chemical, agricultural, geological, mechanical, electrical, and petroleum engineering, chemistry, hydrology, geology, and biology. Those providing consulting services, or performing research. No technical editors or professional writers were surveyed, only technicians, engineers, and researchers whose jobs involved composing reports. Three pedagogical implications are included. N.W.

N82-15997*# Minnesota Univ., St. Paul. Dept. of Rhetoric.

ANALOGICAL ACTS AS CONCEPTUAL STRATEGIES IN SCIENCE, ENGINEERING AND THE HUMANITIES

Victoria M. Winkler *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 559-568 refs (For primary document see N82-15986 06-82)

Avail: NTIS HC A14/MF A01 CSCL 05B

The composing models which operate by means of analogy are identified. The importance of analogical acts in the prewriting stage of the composing process is discussed. The relations between analogical acts and concept formation are explored. A basic correspondence between the analogical thinking employed in successful learning and analogical thinking as a composing strategy is discussed. Teaching analogical acts as conceptual strategies for exploring problems and generating the form and content of discourse is presented in support of the contention that writing is a unique mode of learning. N.W.

N82-15998*# Rice Univ., Houston, Tex.

TRENDS IN LIABILITY AFFECTING TECHNICAL WRITERS

L. P. Driskill *In* NASA. Langley Research Center Tech. Commun., Pt. 2 Dec. 1981 p 597-606 refs (For primary document see N82-15986 06-82)
Avail: NTIS HC A74/MF A01 CSCL 05B

Liability of technical writers for defective products is explored. Documents generated during a product's life cycle (including design memos, design tests, clinical trials, trial use reports, letters, and proposals) become relevant because they are likely to become the only available means of showing that the product was not defectively designed. These documents become the evidence that the product underwent balanced and well considered planning, development, testing, quality control, and field testing. The predicted increased involvement of technical writers in the prevention and defense of product liability claims is cited in view of a greater number of cases turning on 'failure to warn'. N.W.

ANALYSIS OF RESPONSES TO SURVEY OF DTIC'S MILITARY USERS ON CURRENT AND PLANNED TECHNICAL LIBRARY/INFORMATION CENTER AUTOMATION Final Report

Mary Belle Bonnett Oct. 1981 29 p refs
(AD-A105507) Avail: NTIS HC A03/MF A01 CSCL 05/2

This survey was undertaken to determine current use of automated functions in DTIC User Technical Libraries; areas where new services and support were desired from DTIC, and what automation efforts were planned and budgeted. Forty-seven percent of the responses indicate some automated functions in the library concerned, ranging from access to DROLS or commercial services by terminal to totally automated, integrated systems. Responses to the question requesting identification of additional or expanded services from DTIC, 123 requests were indicated. They include: remote site bibliographic files, 18; electronic mail service, 15; consultation and advice, 39; automated library model, 11; dial-up access to DROLS, 12; and other services, 28. A total of 195 specific automation projects were identified as in the plans of respondents. Author (GRA)

A WORKSHOP ON QUALITATIVE INFORMATION RETRIEVAL

Stephen B. Weiner 28 Sep. 1981 66 p refs Workshop held on 18-20 Nov. 1980
(Contract N00014-80-C-0105; Grant NSF IST-80-18904; NR Proj. 049-473)
(AD-A105897) Avail: NTIS HC A04/MF A01 CSCL 05/2

Work in the Office of Administration of the Carter White House on the development of a non-intermediated information retrieval system led to consideration of the problem of information retrieval when controlled vocabulary fails. Discussion of that problem led to the development of a typology of such failures and to an examination of methods of resolving the problems. While a detailed discussion of the typology and the methods of resolution is not appropriate at this point, that typology was presented as the point of departure for deliberation by the Workshop on Qualitative Information Retrieval, the results of which this report summarizes. It is, therefore, appropriate to review briefly that typology. GRA

(Contract DE-AC06-76RL-01830)
(DE81-028022; PNL-SA-9219; CONF-810342-2) Avail: NTIS HC A02/MF A01

A data editor, implemented as a single computational tool combining facilities from data management systems, text editors, graphics packages, and statistics packages with emphasis on research data base manipulation and subsetting techniques is described. The data editor provides an interactive environment to explore and manipulate in particular large data sets. It utilizes a relational data transportability to other data analysis packages. Editing large data sets is discussed. A technique for manipulating portions or subsets of large data sets without physical replication is introduced. An experimental command structure and operating environment are presented. DOE

SUMMARY OF THE GRAPHIC INFORMATION DISPLAY SESSION

D. B. Carr Mar. 1981 5 p Presented at the DOE Statistics Symp., Berkeley, Calif., 27 Oct. 1981
(Contract DE-AC06-76RL-01830)
(DE81-028231; PNL-SA-9370; CONF-811031-1) Avail: NTIS HC A02/MF A01

Examples, principles, and ideas concerning color graphics data displays and n-dimensional pattern recognition in environmental systems are summarized. Access to graphics tools is sketched. Uses of color and exploratory data analysis is considered. State maps and scatter plots are compared. Problems in displaying multidimensional data were addressed. Computer generated movies, useful in displaying a third dimension by motion, and time dependent data, are mentioned. DOE

SELF-DESCRIBING DATA FILE STRUCTURE FOR LARGE DATA SETS

Robert A. Burnett 1981 7 p refs Presented at the 13th Symp. on the Computer Sci. and Statistics Interface, Pittsburgh, 12 Mar. 1981
(Contract DE-AC06-76RL-01830)
(DE81-027997; PNL-SA-9179; CONF-810342-3) Avail: NTIS HC A02/MF A01

A self-describing binary (SDB) data file structure was designed and implemented together with a set of basic data manipulation functions and supporting SDB data access routines. Logical and physical data descriptors are stored in SDB files preceding the data values. SDB files thus provide a common data representation for interfacing diverse software components. The various types of data descriptors and data structures permitted by the file design are described. Data buffering, file segmentation, and a segment overflow handler are also discussed. DOE

PRELIMINARY INTERNAL DATA SCREENING: A COMPONENT OF QUANTITATIVE DATA ANALYSIS IN DATA VALIDATION

David J. Pack 1981 31 p refs Presented at the Am. Statist. Assoc. Meeting, Detroit, 10 Aug. 1981
(Contract W-7405-eng-26)
(CONF-810842-1) Avail: NTIS HC A03/MF A01

Two objectives of preliminary internal data screening are examined. The first, producing a frozen, archived database ready for efficient computer analysis, is defined. It is seen to be achievable through simple computer methodology. The second objective produces a general understanding of key variables, a rough cut at response meaningfulness, a qualification of the type of group present, and an assessment of the expected level of difficulty in comprehensive validation. Initial methodological

suggestions for accomplishing the second objective are made. Appropriateness of its techniques for a general examination of a large database that may contain numerous errors is recognized.

DEVELOPMENT OF THE ALUMINUM-AIR BATTERY FOR ELECTRIC VEHICLE APPLICATIONS
John F. Cooper and Robert V. Homsy 12 Aug. 1981 11 p refs Presented at the 4th Intern. EVDG Conf. and Demonstration, London, 15-16 Sep. 1981
(Contract W-7405-eng-48)
(DE81-028446; UCRL-86560; CONF-810938-1) Avail: NTIS HC A02/MF A01

The development of hardware for the aluminum-air electric vehicle battery is discussed. The polarization curves of large-scale aluminum-air cells (0.1 sq m anodes) were replicated in rapidly-refuelable cells of subscale size (167-sq cm) which were constructed for stacking into multicell modules. Solution-side current collection by a structure which makes point or line contacts at the aluminum/electrolyte interface is described. The technique allows rapid anode addition, minimizes anode fabrication costs, and simplifies cell design. The possible application of solution-side current collection to wedge-shaped cells allowing continuous anode feed and full utilization is discussed. Life-cycle testing of air electrodes in candidate battery electrolytes is reported. Temperature and aluminate concentration transients are modeled using experimental rate data. Program structure, technical strategy, goals, and economic analysis are briefly discussed. DOE

EVALUATING R AND D OPTIONS UNDER UNCERTAINTY. VOLUME 2: ATMOSPHERIC FLUIDIZED-BED COMBUSTION COMMERCIALIZATION STRATEGIES Final Report
A. B. Borison, B. R. Judd, P. A. Morris, and E. C. Walters Aug. 1981 79 p Sponsored by Electric Power Research Inst.
(EPRI Proj. 1432-1)
(DE81-904246; EPRI-EA-1964-Vol-2) Avail: NTIS HC A05/MF A01

A quantitative framework for analyzing commercialization decisions for emerging electrical power generation technologies was developed. The framework addresses the general question of when to freeze a design for commercialization. The framework was developed to help evaluate the benefits of continuing the development of two different designs for atmospheric fluidized bed combustion boilers. EPRI staff participated actively in specifying the scope of the analysis and in providing technical information on the two designs. The framework was demonstrated using this information, supplemented with probablistic judgments by EPRI staff about possible outcomes from the pilot and demonstration stages of development. Based on the technical data and judgments supplied by EPRI staff, the analysis shows a net benefit for proceeding with the development of two designs. DOE

EVALUATING R AND D OPTIONS UNDER UNCERTAINTY. VOLUME 3: AN ELECTRIC-UTILITY GENERATION-EXPANSION PLANNING MODEL Final Report
A. B. Borison, B. R. Judd, P. A. Morris, and E. C. Walters Aug. 1981 114 p refs Sponsored by Electric Power Research Inst.
(EPRI Proj. 1432-1)
(DE81-904237; EPRI-EA-1964-Vol-3) Avail: NTIS HC A06/MF A01

An electric utility generation expansion model developed for use in research and development (R and D) planning under uncertainty is described. The model provides a framework for examining broad utility and R and D planning issues, rather than the specific generation expansion decisions of individual utilities. Unlike existing approaches, the model focuses directly on the demand, technological, and regulatory uncertainties and the long term dynamics that affect the impact of R and D achievements. The model's somewhat aggregate approach to electric utility decision making (to allow repeated application at low cost) can be modified, as needed, for more detailed utility planning. When fully implemented, the model can be applied to the analysis of issues such as technology adoption, reserve margin, unit size, reliability, storage and load management effects, lead time, and government regulation. DOE

N82-16014# Brookhaven National Lab., Upton, N. Y.
APPLICATION OF AN LP MODEL TO STRATEGIC PLANNING OF MULTINATIONAL COOPERATIVE RD AND D PROGRAMS
V. L. Sailor 1981 10 p refs
(Contract DE-AC02-76CH-00016)
(DE81-029325; BNL-29857) Avail: NTIS HC A02/MF A01

An analytical study was initiated to serve as a basis for defining a cooperative strategy for RD and D among International Energy Agency member nations. A flexible energy system model, MARKAL, was developed as the primary tool for the analysis. The flexibility of MARKAL is demonstrated by the fact that the diverse energy systems of sixteen countries and the aggregated European Economic Community have been modeled successfully. MARKAL is a multi-period linear programming model which describes the energy flows, costs, and resource consumption of national energy systems over an extended period of time (1980 to 2020). Various policy options and assumptions about future world situations create a range of scenarios which control the MARKAL solutions. Such options and such postulated conditions, translated into operational indicators to drive the MARKAL model and constrain its solutions, are described. DOE

IMPROVING MUNICIPAL AND INDUSTRIAL WASTE TREATMENT PROCESSES: NUTRITIONAL AND PHYSICAL CONDITIONS THAT REGULATE FLOC FORMATION IN BACTERIA ISOLATED FROM ACTIVATED SLUDGE Project Completion Report, 1 Oct. 1979 - 30 Sep. 1980
Jospeh J. Gauthier 30 Jun. 1981 70 p refs
(Contract DI-14-34-0001-9101)
(PB81-246282; W81-05004; OWRT-A-068-ALA(1)) Avail: NTIS HC A04/MF A01 CSCL 06M

The mechanisms by which sludge microorganisms form floc were studied. In the activated sludge process, microorganisms are separated from the treated wastewater by settling in a clarifier. Sludge settling is dependent upon the ability of the microbes in the mixed liquor to adhere to one another. Several zoogloeal isolates, obtained from both municipal and industrial sludge, were tested for floccing efficiency when they were grown to the logarithmic and stationary phase. GRA

EVALUATION OF A DRESSERATOR SYSTEM TEST VEHICLE
Thomas J. Penninga Jun. 1981 38 p
(PB81-245722; EPA-AA-TEB-81-21) Avail: NTIS HC A03/MF A01 CSCL 13B

A vehicle was tested to determine the feasibility of the Dresser Sonic Flow Carburetor system as applied to a 3-way catalyst system. The testing conducted included: the standard Federal Testing Procedure, Highway Fuel Economy Testing, testing at 20, 40, 60, and 70 degrees F and sulfate testing. The test vehicle achieved emission levels below the 1981 and subsequent model year standards of .41 gm/mile hydrocarbon, 3.4 gm/mile carbon monoxide and 1.0 gm/mile NOx. The vehicle suffered starting problems at lower temperatures but had no driveability problems when warmed up. An extended idle period at the beginning of the cold start test procedure was also used at lower temperature. This modified FTP procedure improved driveability and lowered vehicle emissions somewhat. GEOLOGIC HAZARDS AND THEIR RELATION TO PLANNING, LOCATION, AND DESIGN OF TRANSPORTATION FACILITIES Final Report
James Gamble Jan. 1981 325 p refs Sponsored by the FHA
(PB81-235467; TL-954129; FHWA/CA-81/04) Avail: NTIS HC A14/MF A01 CSCL 13B

The geologic hazards frequently encountered are described, together with field methods for efficiently obtaining the information required for recognition and subsequent documentation of these hazards in a Geologic Hazard Report. The need for District planners to recognize possible geologic hazards on a proposed project at an early stage is emphasized. The principle purpose of a Geologic Hazard Report is to facilitate preparation of the environmental document required for project. Failure of environmental report writers to fully utilize this material results in negative comments by reviewers of the draft copy, thus resulting in delays in achieving an approval of a final draft of Environmental Impact Statements or Negative Declarations. CONSTRUCTION AND USE OF A STANDARD SOURCE FOR FAR INFRARED ASTRONOMY EXPERIMENTS [BAU UND EINSATZ EINER EICHQUELLE FUER FERNINFRAROT-ASTRONOMIE-EXPERIMENTE]
Winfried Jennert Feb. 1981 100 p refs In GERMAN
(MPI-PAE/Extraterr-165; ISSN-0340-8922) Avail: NTIS HC A05/MF A01

A flexible standard radiation source suited for far infrared astronomy experiments is analyzed. The source makes use of two black bodies built in a liquid nitrogen cooled dewar. One of them can be heated to a temperature between 80 and 400K, the other, the reference source, has the temperature of the nitrogen bath. The radiation flux is modulated by numerical control while the exit openings of the black bodies are imaged on the standard source outlet pupil, outside the dewar. The modulated radiation intensity can be adjusted and superposed on the constant reference intensity. A helium cooled Ge-Ga bolometer was calibrated and atmospheric absorption measurements were conducted.

The plasma experiment on board the solar probe HELIOS, consisting of four instruments designed to investigate the interplanetary plasma, or solar wind, is discussed. The velocity distribution functions of the different kinds of particles are measured. Hydrodynamic parameters of the solar wind plasma can then be derived. Three instruments analyze the positive component of the solar wind (protons and heavier ions with energy-per-charge values from 0.155 to 15.32 kV). Two of them permit an angular resolution in both directions of incidence. One instrument measures electrons in the energy range from 0.5 to 1660 eV with a one-dimensional angular resolution.

GAMMA RAY DETECTOR FOR SOLAR MAXIMUM MISSION (SMM) OF NASA Final Report, Jul. 1980
Wolfgang Brunner, Karl Brichzin, and Ernst Sach Bonn Bundesministerium fuer Forschung und Technologie Jun. 1981 174 p refs Partly in GERMAN and ENGLISH Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-020; ISSN-0170-1339) Avail: NTIS HC A08/MF A01; Fachinformationzentrum, Karlsruhe, West Germany DM 33.90

For the SMM (launch 14.2.80) a gamma ray detector was developed, manufactured and tested to measure solar high energetic gamma rays and neutron fluxes within the energy range 10-160 MeV, 4.43 MeV and 2.23 MeV. The main components of the sensor are 7 NaI crystals 3' x 3' and a CsI crystal 30 cm x 7.5 cm. The rejection of charged particles is done by two plastic scintillators and 4 CsI shields. From the beginning of the mission the experiment is working fully successful. Author

THE INTERACTIONS OF THE HELIOS PROBE WITH THE SOLAR WIND PLASMA Final Report, Mar. 1981
Gerd-Hannes Voigt, Ulrich Isensee, and Henning Haassberg Bonn Bundesministerium fuer Forschung und Technologie Aug. 1981 278 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-036; ISSN-0170-1339) Avail: NTIS HC A13/MF A01; Fachinformatins-zentrum, Karlsruhe, West Germany DM 44.30

A space charge cloud is formed around the HELIOS solar probe due to strong photoelectron emission and fade out of solar wind particles. The conducting and isolating parts of the surface are differently charged, resulting in a very complex potential structure in the vicinity of the probe and on the surface. The interactions of the HELIOS probe with the solar wind plasma are described by models based on kinetic theory of plasma. The combination of these models yields and entire and consistent representation of the spacecraft charging and the potential structure. Electron spectra measured by the plasma experiment are analysed and compared with results of the theoretical models.

A COSMIC RAY EXPERIMENT ON BOARD THE SOLAR PROBES HELIOS 1 AND 2 (EXPERIMENT NUMBER 6) Final Report, Dec. 1980
Horst Kunow, Gerd Wibberenz, Guenter Green, Horst Hempe, Bernd Iwers, Reinhold Mueller-Mellin, Manfred Witte, Joachim Fuckner, and Armin Popp (Dornieer-Werke GmbH, Friedrichshafen, West Germany) Bonn Bundesministerium fuer Forschung und Technologie Aug. 1981 118 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-016; ISSN-0170-1339) Avail: NTIS HC A06/MF A01; Fachinformationzentrum, Karlsruhe, West Germany DM 24.80

The HELIOS Cosmic Ray Experiment (E6) is a newly developed instrument to measure high energy charged particles of solar, planetary and galactic origin in the inner solar system. Electrons above 0.3 MeV, protons and heavier nuclei up to Neon with energies above 1.3 MeV/N can be separated. The sensor is a telescope consisting of semiconductor-, Cerenkov- and Scintillaton detectors. The complex data processing system onboard and on ground was developed for optimum use of the very restricted telemetry capacity of the space probe. The properties of the instruments are discussed in detail, followed by short descriptions of the mission, the data evaluation, and the spectrum of scientific results.

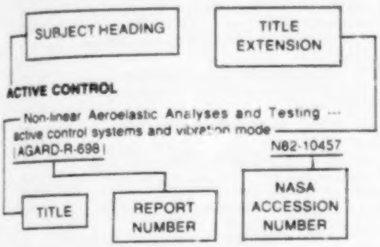
SUBJECT INDEX

Typical Subject Index Listing



The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

Air quality data for nonmetallic inorganic ions: Nitrate and sulfate for 1977 and 1978 from the National Air Surveillance Networks
[PB81-248148] N82-15647

Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] N82-15651

Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654

On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15694

AIR QUALITY

Assessment methodology for the air quality impact of residential wood burning
[DE81-029373] N82-15606

Indoor air quality
[DE81-029857] N82-15611

Workshop on indoor air quality research needs
[DE81-026488] N82-15612

Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613

Technique for planning and managing industrial growth from the air-quality standpoint
[DE81-028342] N82-15614

Air Pollution Pilot Study: Assessment methodology and modeling, 1975 - 1979 (first follow-up report)
[PB81-242257] N82-15629

Practical demonstration of urban air quality simulation models. Part 1: A report of the NATO/CCMS pilot study on air pollution assessment methodology and modeling
[PB81-242240] N82-15630

Air quality data for nonmetallic inorganic ions: Nitrate and sulfate for 1977 and 1978 from the National Air Surveillance Networks
[PB81-248148] N82-15647

AIR TRAFFIC

Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 4 August 1978
[DFVLR-MITT-81-12] N82-15029

AIR TRAFFIC CONTROL

Automated Pilot Advisory System
[NASA-TM-73296] N82-15027

Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 3 August 1979
[DFVLR-MITT-81-17] N82-15028

AIR TRANSPORTATION

The influence of aeronautical R&D expenditures upon the productivity of air transportation
[PB81-247140] N82-15984

Community rotorcraft air transportation benefits and opportunities
[NASA-CR-166266] N82-16008

AIR WATER INTERACTIONS

Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] N82-15684

Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699

AIRBORNE/SPACEBORNE COMPUTERS

Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295

Integrated testing and verification system for research flight software design document
[NASA-CR-159095] N82-15813

Functional description of the ISIS system
[NASA-CR-159152] N82-15814

AIRCRAFT ACCIDENTS

Harmfulness of violent impact and airflow shocks
N82-15742

AIRCRAFT ANTENNAS

Airborne antenna pattern calculations
[NASA-CR-165059] N82-15277

AIRCRAFT CONTROL

NASA aviation safety reporting system
[NASA-TM-81274] N82-15025

An observer approach to the identification and isolation of sensor failures in flight control systems
[DFVLR-FB-81-26] N82-15076

Role of optical computers in aeronautical control applications N82-15897

AIRCRAFT DESIGN

High lift selected concepts
[NASA-CR-159093] N82-15017

AIRCRAFT ENGINES

Advanced compressor components. Phase 1: 1978 to 1979 --- for aircraft engines
[BMFT-FB-W-81-025] N82-15073

High temperature electronic requirements in aeropropulsion systems
[E-708] N82-15313

AIRCRAFT EQUIPMENT

Optical Information Processing for Aerospace Applications
[NASA-CP-2207] N82-15894

AIRCRAFT FUELS

Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596

AIRCRAFT HAZARDS

Human body reaction to vibration N82-15743

AIRCRAFT MANEUVERS

NASA aviation safety reporting system
[NASA-TM-81274] N82-15025

AIRCRAFT NOISE

Noise and sense of hearing N82-15747

AIRCRAFT PARTS

Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198

AIRCRAFT SAFETY

NASA aviation safety reporting system
[NASA-TM-81274] N82-15025

AIRCRAFT STRUCTURES

Estimation methods for the determination of dynamic responses of elastic aircraft --- to random loads
[BMVG-FBWT-81-6] N82-15037

AIRFOIL PROFILES

High lift selected concepts
[NASA-CR-159093] N82-15017

Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039

Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

AIRFOILS

Natural laminar flow airfoil analysis and trade studies
[NASA-CR-159029] N82-15018

Computation of subsonic flow around airfoil systems with multiple separation
[DFVLR-FB-81-24] N82-15021

AIRFRAME MATERIALS

Advantages and limitations in the use of diverse materials for aircraft construction --- composite versus metallic materials
[SNIAS-811-551-104] N82-15011

AIRGLOW

Transmission and emission of the atmosphere; continued measurements and analysis of the data
[PHL-1979-50] N82-15655

AIRPORT LIGHTS

Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements
[IZF-1980-1-VOL-1] N82-15081

Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 2: Intensity measurements
[IZF-1980-12-VOL-2] N82-15082

AIRPORTS

Automated Pilot Advisory System
[NASA-TM-73296] N82-15027

Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 4 August 1978
[DFVLR-MITT-81-12] N82-15029

AITKEN NUCLEI

Comparison between two Aitken counters and with cloud condensation nuclei counters at the 1980 International CCN Workshop N82-15406

ALBEDO
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227796] N82-15673
Satellite observed plantetary albedo and its parameterization
[PB81-236974] N82-15686
ALCOHOLS
Survey of proposed methods of burning alcohol in diesel engines
[DE81-025834] N82-15219
ALGORITHMS
Continuing development of the DEROB system --- calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243
Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry
[SER-C-261] N82-15812
Methodology and basic algorithms of the Livermore Economic Modeling Systems
[DE81-029430] N82-15833
Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834
An algorithm which determines the global least squares equidistant spline fit
[NLR-TR-80006-U] N82-15837
Algorithms developed to obtain particular numerical solutions to the ideal MHD equilibrium problem
[DE81-029691] N82-15955
ALIGNMENT
Construction of a numerically controlled device for aligning optical and mechanical axis of a microscope lens on a lathe
[BMFT-FB-T-81-033] N82-15924
Optical analysis and alignment applications using the infrared Smartt interferometer
[DE81-030257] N82-15937
ALIPHATIC COMPOUNDS
The utilisation of alcohol in light duty diesel engines
[PB81-244469] N82-15452
ALKALI METALS
Use of alkali metal-acid phosphates for elevated temperature water electrolysis
[DE81-029607] N82-15156
ALKALINE BATTERIES
Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes
[BMFT-FB-T-81-053] N82-15585
ALKENES
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 3: Production engineering
[BMFT-FB-T-81-124-VOL-3] N82-15202
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233
ALPHA PARTICLES
Alpha-spectroscopic techniques for field measurement of radon daughters
[DE81-029846] N82-15158
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-236479] N82-15624
A two dimensional position sensitive deltaE-E counter for energetic light charged particles
N82-15882
ALTERNATING CURRENT
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] N82-15338
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345
ALTIMETERS
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] N82-15498
ALTITUDE
Development of the ARIES parachute system
[NASA-TM-84082] N82-15023
ALTITUDE ACCLIMATIZATION
Caisson disease N82-15749
ALTITUDE TOLERANCE
Caisson disease N82-15749
ALUMINUM
High temperature (Al2O3) insulation and light weight conductors N82-15337
Shock-compression measurements at pressures greater than 1 TPa
[DE81-030113] N82-15372
Development of the aluminum-air battery for electric vehicle applications
[DE81-028446] N82-16010
ALUMINUM ALLOYS
Creep recovery and stress relaxation tests of 6061-0 aluminum
[NASA-CR-165056] N82-15167
Hot isostatic pressing of aluminum alloy castings
[AD-A105562] N82-15169
Corrosion of high-temperature materials in AFBC environments. Part 2: 4500-h tests
[DE81-028024] N82-15173
Evaluation of the crack initiation life behavior of fatigue loaded automotive components made from high strength aluminum alloys
[DFVLR-FB-81-10] N82-15459
Small-angle X-ray scattering system with linear position-sensitive detector
[DE81-021920] N82-15967
ALUMINUM GALLIUM ARSENIDES
Transparent GaAlAs luminescent diodes for optical wavelength multiplexing
[BMVG-FBWT-79-18] N82-15936
ALUMINUM NITRIDES
Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231086] N82-15214
ALUMINUM OXIDES
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15086
Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231086] N82-15214
High temperature (Al2O3) insulation and light weight conductors N82-15337
AMAZON REGION (SOUTH AMERICA)
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490
AMINES
Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105596] N82-15964
AMINO ACIDS
All-Union Conference on New Sources of Food Protein and Their Application N82-15765
AMMONIUM PERCHLORATES
Development of a solid propellant with a high level fuel content for Volvo rocket engine AB(VFA)
[FOA-C-20421-D3] N82-15217
AMMONIUM SULFATES
Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product --- ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142
AMORPHOUS MATERIALS
Amorphous metallizations for high-temperature semiconductor device applications N82-15318
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965
AMPLIFICATION
Improvement of radar target searches by a range dependent detection threshold or signal amplification
[FFM-301] N82-15265
AMPLIFIERS
Process characteristics and design methods for a 300 deg quad OP amp N82-15326
Monolithically integrated active optical devices --- with application in optical communication
N82-15916
ANAEROBES
Microbiologic aspects of metal corrosion
N82-15764
ANALOG TO DIGITAL CONVERTERS
XV-15 Tilt Rotor fly-by-wire collective control demonstrator development specifications
[NASA-CR-166262] N82-15030
Minus 55 to plus 200 deg C 12 bit analog-to-digital converter N82-15327
Hybrid A/D converter for 200 deg C operation
N82-15329
ANALOGIES
Analogical acts as conceptual strategies in science, engineering and the humanities N82-15897
ANALYZERS
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433
The AEROS retarding potential analyzer --- for ionospheric plasma parameter determination
[BMFT-FB-W-81-007] N82-15666
ANGULAR ACCELERATION
Medical problems of gravitational changes and powered flight N82-15740
ANGULAR DISTRIBUTION
the 165Ho + 56Fe reaction at E sub lab = 462 MeV N82-15866
ANIMALS
A compendium of hypokinetic and hypodynamic animal studies
[NASA-CR-3485] N82-15706
ANIONS
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310
Improvement of gas efficiency of negative ion sources
[DE81-026031] N82-15862
ANNEALING
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335
ANNIHILATION REACTIONS
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857
ANNUAL VARIATIONS
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15580
Meteorological data, volume 134, number 3: The evolution of the circulation pattern at the 100 mbar level for the years 1973 and 1974 illustrated by maps of monthly mean values --- over the Northern Hemisphere
[ISSN-0342-4332] N82-15676
ANODES
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15166
ANOXIA
The physiological effect of low-air-pressure anoxia
N82-15748
ANTENNA COMPONENTS
Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14839-1] N82-15381
ANTENNA DESIGN
Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] N82-15500
New baseline system N82-15501
Squinted SAR system N82-15502
ANTENNA RADIATION PATTERNS
Airborne antenna pattern calculations
[NASA-CR-165059] N82-15277
Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] N82-15500
New baseline system N82-15501
Squinted SAR system N82-15502
ANTENNAS
Plane-wave scattering-matrix theory of antennas and antenna-antenna interactions
[PB81-245243] N82-15356
ANTIMONY
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
ANTIPROTONS
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857
APERTURES
Aberrations and focusability in large solid-state-laser systems
[DE81-029914] N82-15442

APPLICATIONS PROGRAMS (COMPUTERS)
Overview of the current MITRE effort N82-15099
Short system descriptions
[KFK-PDV-126] N82-15821
APPROACH AND LANDING TESTS (STS)
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing
[NASA-CR-163115] N82-15074
APPROACH CONTROL
Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 3 August 1979
[DFVLR-MITT-81-17] N82-15028
Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 4 August 1978
[DFVLR-MITT-81-12] N82-15029
APPROXIMATION
Introduction to the calculation of parametrically excited oscillations
[ISBN-3-7983-5150-3] N82-15294
AQUEOUS SOLUTIONS
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(nca)2) NCS
[AD-A105595] N82-15964
AQUIFERS
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519
ARC DISCHARGES
High-speed photographic observation of plasma-limiter interactions in ISX-B
[DE81-029669] N82-15427
ARC WELDING
Evaluation of shielded metal arc and flux cored metal arc welding consumables for fabrication of stainless steel magnet cases for 4K service
[DE81-028851] N82-15449
ARCHAEOLOGY
Archaeoastronomy in the Americas --- conference
[BP-AP-22] N82-16023
ARCHITECTURE
Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247
Technology change and energy consumption: A comparison of residential subdivisions
[DE81-030075] N82-15555
Summary of passive solar multi-family design workshops
[DE81-030353] N82-15564
Indoor air quality
[DE81-029857] N82-15611
Workshop on indoor air quality research needs
[DE81-026488] N82-15612
ARCHITECTURE (COMPUTERS)
The architecture of SIRENE: A distributed computer system for teaching
[ENST-C-81004] N82-15802
Optical implementation of systolic array processing N82-15899
Iterative optical vector-matrix processors (survey of selected achievable operations) N82-15904
Optical Spatial integration methods for ambiguity function generation N82-15908
ARGON
Ion beam surface modification
[NASA-CR-165062] N82-15196
Mid-rapidity pion cross sections: New data confront theories
[DE81-026014] N82-15866
ARIZONA
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489
ARTERIES
Non-invasive pulmonary arterial pressure measurement
[PB81-239410] N82-15776
ASHES
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] N82-15624
ASPECT RATIO
Low-speed aerodynamic performance of a high-aspect-ratio supercritical-wing transport model equipped with full-span slat and part-span double-slotted flaps
[NASA-TP-1580] N82-15015
High lift selected concepts
[NASA-CR-159093] N82-15017
The effect of aspect ratio on the unsteady aerodynamic forces induced by vibration of a cascade blade N82-15063
ASPHALT
State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262
ASPHERICITY
Automatic calculation of spheroelliptical systems, essential facts, and elementary traces (cassette): Utilization
[LAS-OPT.INST-02-81] N82-15822
ASSESSMENTS
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-026092] N82-15598
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15509
ASTRONAUT TRAINING
Crew medical training N82-15717
ASTRONAUTS
STS-1 medical report
[NASA-TM-58240] N82-15711
Evaluation of crew health N82-15712
Inflight observations N82-15713
Crew medical debriefing N82-15714
Health stabilization program N82-15715
Crew medical training N82-15717
Validation of predictive tests and countermeasures for space motion sickness N82-15719
Crew cardiovascular profile N82-15720
Biochemistry and endocrinology results N82-15721
Hematological and immunological analyses N82-15722
Medical microbiology of crewmembers N82-15723
Radiological health N82-15727
Space navigation medical guarantees and medical supervision N82-15762
ASTRONOMICAL SPECTROSCOPY
Bulk and integrated acousto-optic spectrometers for radio astronomy N82-15902
Theoretical study of image spots with the wide field camera and the implications for nebular spectrography --- computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15939
Construction and use of a standard source for far infrared astronomy experiments
[MPI-PAE/EXTRATERR-165] N82-16024
Spectroscopic observations of comets
[NASA-CR-165077] N82-16029
ASTRONOMY
Archaeoastronomy in the Americas --- conference
[BP-AP-22] N82-16023
ASTROPHYSICS
Neutrino number of the universe
[DE81-030249] N82-15875
ASYMPTOTES
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841
ASYMPTOTIC SERIES
Projected Markov parameters and multivariable root-loci
[RR-146] N82-15839
ATMOSPHERIC CHEMISTRY
The ROSCOE manual. Volume 26-1: Molecular band model parameters for thermal emissions: Expanded wavelength coverage
[AD-A106077] N82-15659
Surface science of heterogeneous catalysis: Possible applications in atmospheric sciences
[DE81-028135] N82-15663
ATMOSPHERIC CIRCULATION
Reports from the German Meteorological Service. Number 154: Statistics of the maximum mixing height according to radiosonde measurements for the aerological stations of the German Meteorological Service for the period 1957-1973 --- relation to air pollution
[ISSN-0072-4130] N82-15595
Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654
Meteorological data, volume 134, number 3: The evolution of the circulation pattern at the 100 mbar level for the years 1973 and 1974 illustrated by maps of monthly mean values --- over the Northern Hemisphere
[ISSN-0342-4332] N82-15676
ATMOSPHERIC COMPOSITION
Photoacoustic detection of particulate carbon
[PB81-245425] N82-15435
The mass spectrometer experiment in the program AEROS
[BMFT-FB-W-81-030] N82-15657
Atlas of absorption lines from 0 to 17 900 cm(-1)
[NASA-RP-1084] N82-15853
ATMOSPHERIC DENSITY
Thermospheric studies using satellites AEROS A and B --- atmospheric total density determination by the orbital drag technique
[BMFT-FB-W-81-012] N82-15667
ATMOSPHERIC ENTRY
Influence of precursor heating on viscous flow around a Jovian entry body
[NASA-CR-3174] N82-15381
ATMOSPHERIC GENERAL CIRCULATION EXPERIMENT
Feasibility study: Atmospheric general circulation experiment, volume 1
[NASA-CR-161889-VOL-1] N82-15084
Feasibility study: Atmospheric general circulation experiment, volume 2
[NASA-CR-161889-VOL-2] N82-15085
ATMOSPHERIC HEATING
Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699
ATMOSPHERIC MODELS
Status report on DOE-sponsored meteorological model validation program
[DP-MS-81-20] N82-15689
ATMOSPHERIC MOISTURE
Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission
[NASA-CR-166752] N82-15408
ATMOSPHERIC PRESSURE
Caisson disease N82-15749
Dangers of explosive decompression N82-15750
ATMOSPHERIC RADIATION
Evaluation of infrared simulation data
[AD-A105872] N82-15931
ATMOSPHERIC SCATTERING
X-ray methods for the chemical characterization of atmospheric aerosols
[DE81-026874] N82-15603
ATMOSPHERIC SOUNDING
Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission
[NASA-CR-166752] N82-15408
ATOMIC BEAMS
Potential determination of the system sodium (3 2P) plus mercury (6 1S) by measuring and analyzing the rainbow scattering in the superthermal energy domain between 0.3 and 3.2eV
[MPIS-23/1980] N82-15867
ATOMIC COLLISIONS
Continuum electron emission in heavy ion: Atom collisons
[DE81-028234] N82-15860
One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873
Survey of atomic physics issues in experimental inertial confinement research
[DE81-028389] N82-15874
Potential determination of the system sodium (3 2P) plus mercury (6 1S) by measuring and analyzing the rainbow scattering in the superthermal energy domain between 0.3 and 3.2eV
[MPIS-23/1980] N82-15867

ATOMIC EXCITATIONS
Survey of atomic physics issues in experimental inertial confinement research
[DE81-028369] N82-15874

ATOMIC PHYSICS
Survey of atomic physics issues in experimental inertial confinement research
[DE81-028369] N82-15874

ATOMIC STRUCTURE
Actinides 1981
[DE81-030350] N82-15185
Surface science of heterogeneous catalysis: Possible applications in atmospheric sciences
[DE81-028135] N82-15663

ATOMIZERS
Steady generation of aerosols with an improved constant output atomizer N82-15396

ATTENUATION COEFFICIENTS
Attenuation of coaxial pairs in the lower frequency range
[FTZ-FI-21-TBR-61] N82-15268

ATTITUDE CONTROL
Microcomputer for attitude control systems
[BMFT-FB-W-81-040] N82-15112

AUDITORY DEFECTS
Results of the Third International Congress on Noise Effects: As a public health problem; biological disturbances; effects on behavior
[BMFT-FB-HA-81-013] N82-15597

AUDITORY PERCEPTION
Hearing protection
[IZF-1980-2] N82-15783

AUGMENTATION
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637

AURORAL SPECTROSCOPY
Auroral spectrometer AF6 for the POLAR HIGH ATMOSPHERE rocket campaign
[BMFT-FB-W-81-006] N82-15665

AUSTENITE
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

AUSTENITIC STAINLESS STEELS
Precipitation and cavity formation in austenitic stainless steels during irradiation
[DE81-028062] N82-15174
Preirradiation microstructural development designed to minimize properties degradation during irradiation in austenitic alloys
[DE81-028612] N82-15180
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192

AUTOCORRELATION
Energy normalization of TV viewed optical correlation (automated correlation plane analyzer for an optical processor) N82-15903

AUTOMATED PILOT ADVISORY SYSTEM
Automated Pilot Advisory System
[NASA-TM-73296] N82-15027

AUTOMATIC CONTROL
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-168] N82-15252
Managing large-scale models: DBS
[DE81-026683] N82-16006

AUTOMATIC PICTURE TRANSMISSION
Air Force research in optical processing
N82-15895

AUTOMATIC TEST EQUIPMENT
Advanced planar silicon test structures
[PB81-229155] N82-15353
Development of a prototype of a test apparatus for the determination of the thermal conductivity in solids, on powders and foams
[BMFT-FB-T-81-052] N82-15409

AUTOMOBILE ENGINES
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] N82-15453

AUTOMOBILE FUELS
Motor gasolines, winter 1980-81
[DE81-030845] N82-15224
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621

AUTOMOBILES
Air quality analysis for the 1984 High Altitude Report to Congress: Summary of results
[PB81-247702] N82-15620
Compilation of air pollutant emission factors: Highway mobile sources
[PB81-238305] N82-15638

AUTORADIOGRAPHY
Tritium autoradiography
[DE81-030521] N82-15870

AVIONICS
Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295

AXES OF ROTATION
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419

AXIAL STRAIN
Axisymmetric finite deformation membrane problems
[DE81-030070] N82-15464

AXIAL STRESS
Study of traction rupture strength of graphite-epoxy composite material laminates T300/5208, with and without a central hole
[REPT-137] N82-15138

AXISYMMETRIC BODIES
DONBOL: A computer program for predicting axisymmetric nozzle afterbody pressure distributions and drag at subsonic speeds
[NASA-TM-78779] N82-15016

B

BAKING
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15168

BALLISTICS
Electromagnetic launcher: A new weapon
[DE81-029979] N82-15267

BALLOON-BORNE INSTRUMENTS
High temperature electronics applications in space exploration N82-15312
Packaging techniques for low-altitude Venus balloons beacon N82-15336

BALTIC SEA
Laser depth sounding in the Baltic Sea — from airplanes
[FOA-C-30219-E1] N82-15702

BARLEY
US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] N82-15494

BAROCLINIC INSTABILITY
Feasibility study: Atmospheric general circulation experiment, volume 1
[NASA-CR-161889-VOL-1] N82-15084
Feasibility study: Atmospheric general circulation experiment, volume 2
[NASA-CR-161889-VOL-2] N82-15085

BARRIER LAYERS
Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335

BARYONS
Neutrino number of the universe
[DE81-030249] N82-15675

BAYS (TOPOGRAPHIC FEATURES)
Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-238962] N82-15632

BEAM PLASMA AMPLIFIERS
Compact 36 kJ electron beam system for laser pumping
[DE81-024375] N82-15440
Advanced solar energy conversion — solar pumped gas lasers
[NASA-CR-165060] N82-15526

BEAMS (RADIATION)
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176

BEAMS (SUPPORTS)
Detection of flaws in reinforcing steel in prestressed concrete bridge members
[PB81-241630] N82-15258
Calculation of the stress-strain evolution of a pressure-loaded trapezoid aluminum beam before and after reaching elastic limit
[EK47-059-80] N82-15499

BEDDING EQUIPMENT
A criterion for the disposal of M58 sleeping bags
[IZF-1979-15] N82-15782

BENARD CELLS
Thermal convection simulation in three dimensions by a modified finite element method
[DE81-028847] N82-15802

BENDING
Possible applications of the steering of charged particles by bent single crystals
[DE81-028601] N82-15966

BENDING VIBRATION
Inlet distortion and blade vibration in compressible flow between parallel walls N82-15058

BENZENE
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845

BETA FACTOR
Equilibrium and stability of experimental high beta toroidal plasmas
[DE81-023610] N82-15944

BETA PARTICLES
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-236479] N82-15624

BIAS
Research on magneto-optical bias elements for laser gyros
[DFVLR-FB-81-21] N82-15417

BIBLIOGRAPHIES
A bibliography of micro-hardness testing
[NPL-MOM-55] N82-15236
Cloud droplet measurement methods: A bibliography
[DFVLR-MITT-81-04] N82-15691
Impact of weather and climate on agriculture: A selected bibliography
[PB81-245003] N82-15696
Aerospace Medicine and Biology. A continuing bibliography with indexes (supplement 225)
[NASA-SP-7011(225)] N82-15766

BIOACOUSTICS
The sound attenuation of the Wilson earmuff number 250 and the Amplivox, type H4016
[IZF-1979-9] N82-15849

BIOASTRONAUTICS
USSR Space Life Sciences Digest
[NASA-TM-84080] N82-15708
Fundamentals of aeronautical and aerospace medical science
[AD-A102298] N82-15736
Environmental conditions of aviation and space navigation N82-15738
General laws of aviation and space navigation environmental effects on the human body
N82-15739

BIOCHEMISTRY
Biochemistry and endocrinology results
N82-15721
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79639] N82-15763
Microbiologic aspects of metal corrosion
N82-15764

BIOCONVERSION
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234

BIODEGRADATION
Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise
[PB81-246068] N82-15704
Ecological and technological problem of biodamages N82-15756

BIODYNAMICS
NASA biomedical Applications Team Advisory Center for Medical Technology and Systems
[NASA-CR-166755] N82-15770

BIOENGINEERING
NASA biomedical applications team. Applications of aerospace technology in biology and medicine
[NASA-CR-152883] N82-15710

BIOLOGICAL EFFECTS
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-028880] N82-15507
Results of the Third International Congress on Noise Effects: As a public health problem; biological disturbances; effects on behavior
[BMFT-FB-HA-81-013] N82-15597
Ionizing radiation and its biological effects
N82-15756
Other biological effects of radiation N82-15757
Aerospace Medicine and Biology. A continuing bibliography with indexes (supplement 225)
[NASA-SP-7011(225)] N82-15768

BIOLOGICAL MODELS (MATHEMATICS)
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9096] N82-15599

BIOMASS
Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] N82-15504
Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587

BIOMASS ENERGY PRODUCTION
Thermochemical production of liquids from biomass
[DE81-030085] N82-15226
Individual biomass facility reports. Supplement to some employment and earnings implications of regional biomass energy utilization: New England and the Cornbelt States
[DE81-028523] N82-15550

BIOMEDICAL DATA
NASA biomedical applications team. Applications of aerospace technology in biology and medicine
[NASA-CR-152883] N82-15710
STS-1 medical report
[NASA-TM-58240] N82-15711
Medical information management N82-15730
NASA biomedical Applications Team Advisory Center for Medical Technology and Systems
[NASA-CR-166755] N82-15770

BIOMETRICS
Inflight observations N82-15713

BIOSPHERE
Model of Climate and Global Ecology N82-15477

BIOSYNTHESIS
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] N82-15509

BIPOLAR TRANSISTORS
Optimizing development of a bipolar stepping motor with electronic circuit for quartz analogue clocks
[BMFT-FB-T-81-077] N82-15299
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320
A gallium phosphide high-temperature bipolar junction transistor N82-15323
High temperature LSI N82-15332

BIRDS
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481

BITS
Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15288

BLACK BODY RADIATION
National synchrotron light source in the infrared region
[DE81-030037] N82-15932

BLACKOUT PREVENTION
Man's adaptation to weightlessness and low weight N82-15746

BLANKETS (FUSION REACTORS)
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
Thermal conductivity measurements of insulators for fusion blankets
[DE81-030028] N82-15953

BLASIUS FLOW
Calculation of three-dimensional instability modes in a Blasius boundary layer
[IC-AERO-81-01] N82-15377

BLOOD PLASMA
Biochemistry and endocrinology results
N82-15721

BLOOD PRESSURE
Crew cardiovascular profile N82-15720
Non-invasive pulmonary arterial pressure measurement
[PB81-239410] N82-15776

BLOOD VOLUME
Hematological and immunological analyses
N82-15722

BLUE GREEN ALGAE
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234

BODIES OF REVOLUTION
Localized loads applied to shells of revolution
[KFK-CAD-155] N82-15470

BODY SWAY TEST
Use of a television multipoint x-y tracker for determining the transmission of vibrations on human beings — human factors in man machine systems
N82-15787

BODY TEMPERATURE
The relationship of body temperature to environmental temperature N82-15752
Comfortable temperature and tolerable temperature N82-15753
The physiological effect of heat and its prevention
N82-15754
The effect of cold and the cold prevention
N82-15755

BOEING 747 AIRCRAFT
Selected advanced aerodynamic and active control concepts development
[NASA-CR-3220] N82-15033

BOILERS
Moorhead district heating, phase 2
[DE81-029689] N82-15556
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012

BOILING
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233

BONDING
COST 50: Materials for gas turbines N82-15071

BORATES
Electrical switching in cadmium boracite single crystals N82-15325

BOREHOLES
Development of tests and criteria to evaluate grounding systems
[PB81-238354] N82-15522
Sandia program in geothermal technology development
[DE81-025394] N82-15546

BORON NITRIDES
Development of an 1100 deg F capacitor
N82-15315

BOUNDARY LAYER TRANSITION
Correlation of transonic-cone Preston-tube data and skin friction — characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019
Calculation of three-dimensional instability modes in a Blasius boundary layer
[IC-AERO-81-01] N82-15377

BOUNDARY LAYERS
Elements for the numerical analysis of wave motion in layered media
[PB81-245268] N82-15292

BOUNDARY VALUE PROBLEMS
The construction of an accurate lower bound for the real parts of the eigen values of an M-matrix
[MC-NW-102/81] N82-15827
On the choice of suitable operators and parameters in multigrid methods — for solving elliptic boundary value problems
[MC-NW-107/81] N82-15829

BRAGG ANGLE
A broadband RF continuously variable time delay device — using Bragg cell and optical heterodyne technology for signal processing N82-15915

BRAZIL
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] N82-15485
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] N82-15486
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490

BRAZING
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15088
Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093

BREAKWATERS
Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-238982] N82-15632

BREEDER REACTORS
Wireless, in-vessel neutron monitor for initial core-loading of advanced breeder reactors
N82-15330

BREMSSTRAHLUNG
Parameterization of the bremsstrahlung spectrum
[DE81-029739] N82-15859

BRIDGES (STRUCTURES)
Vertical motion of highway bridge structure due to an earthquake
[PB81-235319] N82-15254
Detection of flaws in reinforcing steel in prestressed concrete bridge members
[PB81-241630] N82-15258

BRIGHTNESS
National synchrotron light source in the infrared region
[DE81-030037] N82-15932

BRINES
Sampling and analysis of potential geothermal sites
[PB81-240061] N82-15593

BROADBAND
System concepts and basic technologies for receiver components of digital radio link systems at 20 GHz
[BMFT-FB-T-81-166] N82-15281

BROMINE COMPOUNDS
Corrosion of type 316 stainless steel in molten LiF-LiCl-LiBr
[DE81-028633] N82-15172

BUBBLES
Computation of subsonic flow around airfoil systems with multiple separation
[DFVLR-FB-81-24] N82-15021

BUILDINGS
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028896] N82-15242

BUMPY TORUSES
Progress toward fusion energy
[UCRL-84974] N82-15888

BUOYS
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] N82-15498

BURNING RATE
Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] N82-15608

BURNS (INJURIES)
A heat transfer analysis of scald injury
[PB81-238503] N82-15777

BY-PRODUCTS
The conversion of agricultural by-products to sugars
[PB81-241432] N82-15568

C

CABIN ATMOSPHERES
Environmental conditions of aviation and space navigation N82-15738

CADMIUM COMPOUNDS
Electrical switching in cadmium boracite single crystals N82-15325

The 2-4-52 chalcopyrites for high speed devices
[AD-A108107] N82-15862

CADMIUM SELENIDES
Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535

CADMIUM SULFIDES
Process development for large-scale production of CdS thin film solar cells Sputtered copper sulfide layers and cadmium sulfide-copper sulfide heterojunctions. Application of high rate sputtering using hot-pressed targets
[BMFT-FB-T-81-089] N82-15528
Development of a process for an inexpensive production of thin film solar cells on an industrial scale
[BMFT-FB-T-81-159] N82-15539

CALCIUM SILICATES
Thermodynamics and kinetics of the sulfation of porous calcium silicate
[NASA-TM-82769] N82-15119

CALIBRATING
Calibration and data correction procedures for flow meters and pressure transducers commonly used by the Coastal Studies Unit
[AD-A105594] N82-15418
Laboratory and field portable system for calibrating airborne multispectral scanners
[DE81-029740] N82-15428
Photoacoustic detection of particulate carbon
[PB81-245425] N82-15435
Construction and use of a standard source for far infrared astronomy experiments
[MPI-PAE/EXTRATERR-165] N82-16024

CALIFORNIA
Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482

CAMERAS
Development of a process camera lens with variable focal length
[BMFT-FB-T-81-155] N82-15415

CANADA
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] N82-15484
US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] N82-15494

CAPACITORS
Passive components for high temperature operation N82-15314
Development of an 1100 deg F capacitor
N82-15315
Performance and cost analysis of large capacitor banks using Weibull statistics and MTBF
[DE81-024364] N82-15342

CARBON
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15168
Photoacoustic detection of particulate carbon
[PB81-245425] N82-15435

CARBON DIOXIDE LASERS
The signal to noise ratio of a heterodyne laser detection system
[PHL-1980-11] N82-15438
Use of Zernike polynomials and interferometry in the optical design and assembly of large carbon-dioxide laser systems
[DE81-030138] N82-15443
Optical tooling for Antares
[DE81-030256] N82-15444
Phase aberrations and beam cleanup techniques in carbon-dioxide laser fusion systems
[DE81-030139] N82-15445
CO2 laser waveguiding in proton implanted GaAs
N82-15912

CARBON FIBER REINFORCED PLASTICS
Study of high quality composite materials at Limours, France N82-15129

CARBON FIBERS
Monitoring techniques for carbon fiber emissions: Evaluation B
[PB81-247413] N82-15619

CARBON ISOTOPES
Study of structure of nuclei with neutrons and nuclear data measurements for MFE
[DE81-028368] N82-15854

CARBON MONOXIDE
Mechanistic studies of carbon monoxide reduction
[DE81-030063] N82-15157
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446
Compilation of air pollutant emission factors: Highway mobile sources
[PB81-236305] N82-15638
Review and update of modeling analysis of carbon monoxide emissions in Mecklenburg County, North Carolina
[PB81-248841] N82-15639

CARBON TETRAFLUORIDE
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359

CARBURETORS
Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019

CARRIER INJECTION
High temperature LSI N82-15332

CASCADE FLOW
Calculation of hydrodynamic interaction of the arbitrary profile cascades in the flow of ideal liquid
N82-15043
Aerodynamic analysis of cascaded airfoils in unsteady rotational flow — prediction of flow induced vibrational stress N82-15044
Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation
N82-15045
Force and moment coefficients for high deflection cascades — theory behind a computer program
N82-15046
Self excited flow oscillation in the low pressure steam turbine cascade N82-15049
Stability and flutter analysis of turbine blades at low speed N82-15050
Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow N82-15051
Numerical experiments on unsteady flows through vibrating cascades N82-15052
On the numerical analysis of stall flutter in turbine cascades N82-15054
Control of vibration in aeroelastic cascade experiments N82-15056
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062
The effect of aspect ratio on the unsteady aerodynamic forces induced by vibration of a cascade blade N82-15063
Three-dimensional periodic disturbances acting upon airfoils in cascade N82-15064
Study of acoustic resonance of cascades — sound generated by guide vanes; wind tunnel investigations
N82-15068
Aspects of acoustic resonance phenomena in turbomachines N82-15069
Acta mechanica sinica (selected articles)
[AD-A108123] N82-15362
Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363
Calculation of unstarted-choked regime of supersonic and transonic compressor cascades
N82-15364

CASE BONDED PROPELLANTS
Development of a solid propellant with a high level fuel content for Volvo rocket engine AB(VFA)
[FOA-C-20421-D3] N82-15217

CAST ALLOYS
Hot isostatic pressing of aluminum alloy castings
[AD-A105562] N82-15169

CASTINGS
Hot isostatic pressing of aluminum alloy castings
[AD-A105562] N82-15169

CATALYSTS
Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607

CATALYTIC ACTIVITY
Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552
Surface science of heterogeneous catalysis: Possible applications in atmospheric sciences
[DE81-028135] N82-15669

CATHODES
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183

CAVITIES
Precipitation and cavity formation in austenitic stainless steels during irradiation
[DE81-026062] N82-15174

CDC 7600 COMPUTER
Specifications of Sandia prototype network communications interface between applications software and NSC A120 adapters
[DE81-028451] N82-15824

CELL ANODES
Development of the aluminum-air battery for electric vehicle applications
[DE81-028446] N82-16010

CELLULOSE
The effect of fire retardants on the heat-release rate of building materials
[PB81-238487] N82-15259

CEMENTS
Dimensions, volume 65, number 3
[PB81-235053] N82-15436

CENSORED DATA (MATHEMATICS)
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

CENSUS
Fuels and electric energy consumed
[PB81-240442] N82-15594

CENTER OF GRAVITY
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

CENTRAL AMERICA
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] N82-15589
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
Archaeoastronomy in the Americas — conference
[BP-AP-22] N82-16023

CENTRAL PROCESSING UNITS
ERSYS-SPP access method subsystem design specification
[E82-10015] N82-15493
Energy normalization of TV viewed optical correlation (automated correlation plane analyzer for an optical processor) N82-15903
Iterative optical vector-matrix processors (survey of selected achievable operations) N82-15904
Three methods for performing Hankel transforms
N82-15906
Optical recognition of statistical patterns
N82-15907
Optical Spatial integration methods for ambiguity function generation N82-15908

CENTRIFUGAL COMPRESSORS
Advanced compressor components. Phase 1: 1978 to 1979 — for aircraft engines
[BMFT-FB-W-81-025] N82-15073

CENTRIFUGES
Numerical simulation of the countercurrent flow in a gas centrifuge
[DE81-030283] N82-15374

CERAMIC COATINGS
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527

CERAMICS
Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207

Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-026366] N82-15209

US ceramic heat exchanger technology: Status and opportunities
[DE81-029686] N82-15210

CERMETS

Investigation on the applicability of slip casting for the production of cermets under microgravity conditions
[BMFT-FB-W-81-017] N82-15091

CESIUM

Improvement of gas efficiency of negative ion sources
[DE81-026031] N82-15862

Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15972

CETANE

Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233

CHANNEL CAPACITY

Information capacity of Gaussian channels
[AD-A105659] N82-15283

CHANNEL NOISE

Estimation of the parameters of an unmodulated carrier signal disturbed by complex-multiplicative and additive Gaussian noise
[DFVLR-FB-81-23] N82-15291

CHANNELS (DATA TRANSMISSION)

Study of the structure of a process control system consisting of units for signal processing, operator stations and process computer
[BMFT-FB-T-81-135] N82-15280

CHARGE COUPLED DEVICES

Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB81-244071] N82-15354

High speed techniques for synthetic aperture radar image formation N82-15698

CHARGE DISTRIBUTION

the 165Ho + 56Fe reaction at E sub lab = 462 MeV N82-15886

CHARGE FLOW DEVICES

Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296

CHARGE TRANSFER

One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873

Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880

Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15972

CHARGED PARTICLES

Design and performance of the new cathode readout proportional chambers in LASS
[DE81-028097] N82-15422

Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15658

A two dimensional position sensitive deltaE-E counter for energetic light charged particles
N82-15882

Possible applications of the steering of charged particles by bent single crystals
[DE81-028601] N82-15966

A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039

CHARRING

The effect of fire retardants on the heat-release rate of building materials
[PB81-238487] N82-15259

CHEMICAL ANALYSIS

Motor gasolines, winter 1980-81
[DE81-030645] N82-15224

Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600

National performance audit program: 1979 proficiency surveys for sulfur dioxide, nitrogen dioxide, carbon monoxide, sulfate, nitrate, lead and high volume flow
[PB81-239402] N82-15646

CHEMICAL CLEANING

On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-83] N82-15448

CHEMICAL COMPOSITION

Interfacial structures in nickel-based transition joints after long term service
[DE81-903971] N82-15155

Elemental composition of aerosols in fourteen experiments of the Cloud Condensation Nuclei Workshop N82-15405

Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617

Network for the measurement of the chemical composition of precipitation in the Netherlands
[KNMI-156-3] N82-15681

CHEMICAL ELEMENTS

Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610

CHEMICAL PROPERTIES

Aeronautical applications of bonding
[SNIAS-812-551-102] N82-15010

CHEMICAL REACTIONS

Stereochemistry of reaction involving cyclic peroxides
[AD-A105999] N82-15146

Computer simulation of bulk and surface chemical diffusion of light atoms in metals
[DE81-025159] N82-15175

Actinides 1981
[DE81-030350] N82-15185

Reaction rates from pressure-gauge measurements in reacting explosives
[DE81-030252] N82-15230

CHLORATES

The electrochemistry of molten lithium chlorate and its possible use with lithium in a battery
[AD-A105968] N82-15145

CHROMATOGRAPHY

Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195

CHROMIUM COMPOUNDS

Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105596] N82-15964

CHRONIC CONDITIONS

New approaches to treatment of chronic pain: A review of multidisciplinary pain clinics and pain centers
[PB81-240913] N82-15778

CIRCUITS

Electrochromic displays
[BMFT-FB-T-81-141] N82-15306

Proceedings of the Conference on High-temperature Electronics
[NASA-TM-84069] N82-15311

Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834

CLADDING

Investigation of semiconductor clad optical waveguides
[NASA-CR-165074] N82-15278

CLASSIFICATIONS

Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures --- crop acreage estimation
[E82-10013] N82-15491

CLAYS

Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264

Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705

CLEAN ENERGY

Indoor air quality
[DE81-029857] N82-15611

Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621

CLEANING

Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product --- ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142

Phase aberrations and beam cleanup techniques in carbon-dioxide laser fusion systems
[DE81-030139] N82-15445

CLIMATE

USSR report: Earth sciences, no. 18
[JPRS-79831] N82-15476

Model of Climate and Global Ecology N82-15477

Potential change in climate by year 2000
N82-15478

Climates of past as a model of future climate
N82-15479

Reports from the German Meteorological Service. Number 155: Two hundred years of meteorological observations at Hohenpeissenberg (1781-1980)
[ISSN-0072-4130] N82-15675

CLIMATOLOGY

Yearbook A Meteorology volume 132
[KNMI-97-132] N82-15682

Climatology of high damaging wind in Illinois
[PB81-234767] N82-15683

CLINICAL MEDICINE

NASA biomedical applications team. Applications of aerospace technology in biology and medicine
[NASA-CR-152663] N82-15710

NASA biomedical Applications Team Advisory Center for Medical Technology and Systems
[NASA-CR-166755] N82-15770

New approaches to treatment of chronic pain: A review of multidisciplinary pain clinics and pain centers
[PB81-240913] N82-15778

CLOCKS

Optimizing development of a bipolar stepping motor with electronic circuit for quartz analogue clocks
[BMFT-FB-T-81-077] N82-15299

Experimental study for rechargeable sealed Ni/Cd watch batteries
[BMFT-FB-T-81-129] N82-15586

CLOUD CHAMBERS

Contribution to CCN Workshop report from University of Wyoming group N82-15384

Description and discussion of the NRL TGDCC
N82-15385

The CCN counter of the IOPG of Puy de Dome: Main characterisics and results of measurements
N82-15386

Static diffusion cloud chambers N82-15389

An airborne isothermal haze chamber N82-15390

A description of the UK Meteorological Office CCN counter N82-15391

Cloud condensation nucleus counter by impactor sampling technique N82-15392

Description of the NRL isothermal haze chamber
N82-15395

Modified MEE Industries static thermal gradient diffusion cloud chamber N82-15396

Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397

CCN comparisons of static diffusion chambers
N82-15399

Performance of the continuous flow diffusion chambers N82-15402

Review of isothermal haze chamber performance
N82-15403

Aerosol generation and distribution system for the Third International Cloud Condensation Nuclei Workshop N82-15404

Comparison between two Aitken counters and with cloud condensation nuclei counters at the 1980 International CCN Workshop N82-15406

CLOUD COVER

Radiation characteristics of cloud fields --- transmission, reflection, emission
[MITT-30] N82-15669

Satellite observed plantetary albedo and its parameterization
[PB81-238974] N82-15686

CLOUD PHOTOGRAPHY

An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156883] N82-15678

CLOUD PHYSICS

Formation and spreading of explosive and toxic gas clouds. A study of the literature
[FOA-C-40141-C1] N82-15379

The Third International Cloud Condensation Nuclei Workshop — conference
[NASA-CP-2212] N82-15383

MRI airborne research studies in support of HIPLEX
[PB81-243750] N82-15695

CLOUD SEEDING

MRI airborne research studies in support of HIPLEX
[PB81-243750] N82-15695

CLOUDS

Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677

CLOUDS (METEOROLOGY)

Characteristics of rain and rain systems N82-15271

Study of the influence of precipitations and clouds on the performance of synthetic aperture radars
[ESA-CR(P)-1465] N82-15290

Cloud droplet measurement methods: A bibliography
[DFVLR-MITT-81-04] N82-15691

CMOS

Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317

High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333

COAL

Moorhead district heating, phase 2
[DE81-029689] N82-15556

COAL GASIFICATION

Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604

Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609

Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] N82-15623

COAL LIQUEFACTION

Thermolysis of naphthols
[DE81-029684] N82-15152

Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221

Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552

Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] N82-15623

COAL UTILIZATION

Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] N82-15222

Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514

Use of coal cleaning for compliance with SO2 emission regulations
[PB81-247520] N82-15616

COASTAL CURRENTS

Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706

COASTAL WATER

Research programme 1981/82 — water science N82-15474

Performance testing of the Soviet oil/debris skimmer
[PB81-244790] N82-15644

Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703

COASTS

Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-236982] N82-15632

COATINGS

Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176

Thin film adhesion and deadhesion
[DE81-028415] N82-15206

COAXIAL CABLES

Cost functions of the long-term planning of digital transmission systems using coaxial cables
[FTZ-FI-03-TBR-14] N82-15267

Attenuation of coaxial pairs in the lower frequency range
[FTZ-FI-21-TBR-51] N82-15268

COBALT

Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair
[DE81-030235] N82-15581

COBOL

DECSYSTEM-20, model 2060, COBOL-74, version 12B
[PB81-233983] N82-15803

DECSYSTEM-10, model 1090-SMP COBOL-74, version 12B
[PB81-233975] N82-15804

Northern Telecom, Inc., COBOL/3. Indexed I-O module
[PB81-233991] N82-15805

Basic four information systems division (MAI)/S80 COBOL version 1.00 indexed I-O module
[PB81-248114] N82-15807

International Business Machines, Inc., System/34 COBOL, 5726-CB1 Release 7 with PTF 07096
[PB81-249088] N82-15808

International Business Machines, Inc., System/38 COBOL, 5714-CB1 Release 2
[PB81-249104] N82-15809

International Business Machines, Inc., 5714-CB1 Release 2, Indexed I-O module
[PB81-249112] N82-15810

International Business Machines, Inc., 5726-CB1 Release 7 with PTF-07096, Indexed I-O module
[PB81-249120] N82-15811

COGENERATION

Moorhead district heating, phase 2
[DE81-029689] N82-15556

COHERENT LIGHT

Investigation of a coherent optical method for roughness measurements
[BMFT-FB-T-81-065] N82-15923

COHERENT RADIATION

Other biological effects of radiation N82-15757

COKE

Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980
[PB81-244808] N82-15616

COLD ACCLIMATIZATION

The effect of cold and the cold prevention N82-15755

COLD FLOW TESTS

Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019

COLD ROLLING

Superconducting critical current density as a probe of defects in metallic glasses
[DE81-028138] N82-15341

COLD TOLERANCE

The physiological effect of heat and its prevention N82-15754

The effect of cold and the cold prevention N82-15755

COLD WORKING

Notch tensile behavior of irradiated 20 percent cold-worked Type 316 stainless steel
[DE81-028170] N82-15181

COLLIMATION

Other biological effects of radiation N82-15757

COLLIMATORS

Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176

COLLISION PARAMETERS

Continuum electron emission in heavy ion: Atom collisons
[DE81-028234] N82-15860

Effects of reagent translational and vibrational energy on the dynamics of endothermic reactions
[DE81-028122] N82-15969

COLLISIONLESS PLASMAS

The aerodynamics of bodies in a rarefied ionized gas with applications to spacecraft environmental dynamics
[NASA-TP-1933] N82-15116

COLLOIDAL GENERATORS

Aerosol generation and distribution system for the Third International Cloud Condensation Nuclei Workshop N82-15404

COLOR

Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements
[IZF-1980-1-VOL-1] N82-15081

Summary of the Graphic Information Display Session
[DE81-028231] N82-16003

COLOR TELEVISION

Integrated filter for video color processing
[BMFT-FB-T-81-065] N82-15300

COMBUSTION CHAMBERS

Effect of fuel injector type on performance and emissions of reverse-flow combustor
[NASA-TP-1945] N82-15040

Investigations of flowfields found in typical combustor geometries
[NASA-CR-165061] N82-15360

Raman-scattering gas temperature measurements in particle-laden flows
[DE81-029621] N82-15370

COMBUSTION PRODUCTS

Assessment methodology for the air quality impact of residential wood burning
[DE81-029373] N82-15606

Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607

Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] N82-15608

Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613

Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] N82-15624

COMET HEADS

Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

COMET NUCLEI

Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

COMET TAILS

Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

COMETS

Spectroscopic observations of comets
[NASA-CR-165077] N82-16029

Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

COMFORT

Comfortable temperature and tolerable temperature N82-15753

COMMAND AND CONTROL

Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 1: Overview
[AD-A106102] N82-15284

Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 2: Knowledge base
[AD-A106103] N82-15285

Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 3: Program source files
[AD-A106104] N82-15286

COMMERCIAL AIRCRAFT

Natural laminar flow airfoil analysis and trade studies
[NASA-CR-159029] N82-15018

COMMERCIAL ENERGY

Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247

Fuels and electric energy consumed
[PB81-240442] N82-15594

COMMUNICATING

Evaluation of the passive solar for agriculture program
[DE81-030056] N82-15565

COMMUNICATION
Identifier protection in a distributed operating system
[DE81-025978] N82-15844
COMMUNICATION NETWORKS
Fault detection and surveillance for a link in a data transmission network
[ENST-D-80010] N82-15269
COMMUNICATION THEORY
Technical communication. Perspectives for the Eighties, part 2
[NASA-CP-2203-PT-2] N82-15986
Some technical writing skills industry needs N82-15987
Technical writing versus technical writing N82-15988
Whys and hows of in-house writing N82-15989
Technical writing practically unified through industry N82-15990
The composing process in technical communication N82-15991
A case study of the influences of audiance and purpose on the composing processes of an engineer N82-15992
COMMUNITIES
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243008] N82-15634
Community noise assessment manual: Social survey workbook
[PB81-244360] N82-15635
Community noise assessment manual: Computer programs for the Strategy Guidelines for Developing a Community Noise Control Program
[PB81-243024] N82-15641
Community noise assessment manual: Strategy guidelines for developing a community noise control program
[PB81-244352] N82-15642
Community rotorcraft air transportation benefits and opportunities
[NASA-CR-166266] N82-16008
COMPACTING
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
COMPARISON
Comparison of computer codes (CE-THERM, FRAP-T5, GT3-FLECHT, and TRUMP-FLECHT) with data from the NRU-LOCA thermal hydraulic tests
[DE81-028136] N82-15817
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841
COMPILERS
DECSYSTEM-20, model 2060, COBOL-74, version 12B

COMPRESSIBILITY
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
COMPRESSIBLE FLOW
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039
COMPRESSOR BLADES
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039
Calculation of unstarted-choked regime of supersonic and transonic compressor cascades N82-15364
COMPRESSORS
Incremental cooling load determination for passive direct gain heating systems
[DE81-029882] N82-15575
COMPUTATION
Continuing development of the DEROB system --- calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243
Incremental cooling load determination for passive direct gain heating systems
[DE81-029882] N82-15575
COMPUTATIONAL FLUID DYNAMICS
Comparison of two and three dimensional flow computations with laser anemometer measurements in a transonic compressor rotor
[NASA-TM-82777] N82-15020
Aeroelasticity in turbomachines --- conference proceedings
[EPFL-ITA-10] N82-15042
Calculation of hydrodynamic interaction of the arbitrary profile cascades in the flow of ideal liquid N82-15043
Aerodynamic analysis of cascaded airfoils in unsteady rotational flow --- prediction of flow induced vibrational stress N82-15044
Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation N82-15045
Force and moment coefficients for high deflection cascades --- theory behind a computer program N82-15046
Aerodynamic response of a blade in pitching oscillation with partial and full separation --- measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel N82-15047
Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow N82-15051
Numerical experiments on unsteady flows through vibrating cascades N82-15052
Computer aided investigation of turbomachine aerodynamics and aeroelasticity N82-15053
A method for force determination from vibration response measurements --- application to turbomachine blades N82-15055
Three-dimensional periodic disturbances acting upon airfoils in cascade N82-15064
Acta mechanica sinica (selected articles)
[AD-A108123] N82-15362
On the regularity of the principle value of the double layer potential --- the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828
COMPUTER ASSISTED INSTRUCTION
The architecture of SIRENE: A distributed computer system for teaching

[PB81-249120] N82-15811
Integrated testing and verification system for research flight software design document
[NASA-CR-159095] N82-15813
Functional description of the ISIS system
[NASA-CR-159152] N82-15814

COMPUTER TECHNIQUES
Implementation and application of a set theoretical data base system
[BMFT-FB-DV-81-004] N82-15797

COMPUTERIZED DESIGN
High lift selected concepts
[NASA-CR-159093] N82-15017
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041
User's guide: Computer Program for Three-dimensional Analysis of Building Systems (CTABS80)
[AD-A105513] N82-15241
Computer aids for circuits designs — computerized design for reproduction of integrated circuits
[BMFT-FB-T-80-165] N82-15348
Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834

COMPUTERIZED SIMULATION
Computer simulation of bulk and surface chemical diffusion of light atoms in metals
[DE81-025159] N82-15175
Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15288
Computer aids for circuits designs — computerized design for reproduction of integrated circuits
[BMFT-FB-T-80-165] N82-15348
Hull/EPIC3 linked Eulerian/Lagrangian calculation in three dimension
[AD-A106033] N82-15368
Incremental cooling load determination for passive direct gain heating systems
[DE81-029882] N82-15575
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] N82-15602
Temperature histories in geothermal wells: Survey of rock thermomechanical properties and drilling, production, and injection case studies
[DE81-029957] N82-15662
Terrestrial solar spectral modeling
[DE81-029067] N82-15684
Short system descriptions
[KFK-PDV-126] N82-15821
Thermal convection simulation in three dimensions by a modified finite element method
[DE81-028647] N82-15832
Computer simulation of organic and biological molecules --- conferences
[DE81-029948] N82-15871

COMPUTERS
Minicomputer and computer numerical control maintenance
[DE81-030645] N82-15800
Concerning technical means for dealing with aspects of the near-term information onslaught
[DE81-030159] N82-16007

CONCENTRATION (COMPOSITION)
Heating oils, 1981
[DE81-030833] N82-15223

CONCENTRATORS
Low-cost mirror concentrator based on inflated, double-walled, metalized, tubular films
[DE81-027813] N82-15551

CONCRETE STRUCTURES
Detection of flaws in reinforcing steel in prestressed concrete bridge members
[PB81-241630] N82-15258
Finite-element program for creep analysis of concrete structures
[DE81-028071] N82-15460

CONCRETES
Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473

CONDENSATES
Sound damping in a condensation loaded gas flow
[MPIS-24/1980] N82-15852

CONDENSING
The Third International Cloud Condensation Nuclei Workshop --- conference
[NASA-CP-2212] N82-15383
Contribution to CCN Workshop report from University of Wyoming group N82-15384
Description and discussion of the NRL TGDCC N82-15385
The CCN counter of the IOPG of Puy de Dome: Main characterisics and results of measurements N82-15386
UMR dual mode CCN counter (modes: CFD plus haze) N82-15387
A cloud condensation nucleus spectrometer designed for airborne measurements N82-15388
Static diffusion cloud chambers N82-15389
An airborne isothermal haze chamber N82-15390
A description of the UK Meteorological Office CCN counter N82-15391
Cloud condensation nucleus counter by impactor sampling technique N82-15392
Diffusion tube N82-15393

An automatic light scattering CCN counter N82-15394
Description of the NRL isothermal haze chamber N82-15395
Modified MEE Industries static thermal gradient diffusion cloud chamber N82-15396
Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397
CCN comparisons of static diffusion chambers N82-15399
CCN-supersaturation spectra slopes (k) N82-15400
Performance of the continuous flow diffusion chambers N82-15402
Review of isothermal haze chamber performance N82-15403
Elemental composition of aerosols in fourteen experiments of the Cloud Condensation Nuclei Workshop N82-15405

CONDUCTIVE HEAT TRANSFER
Development and adaptation of conduction and radiation heat-transfer computer codes for the CFTL [DE81-028033] N82-15369
Heat transport and conduction layers in gravity-assisted heat pipes [IKE-5-212] N82-15376

CONDUCTORS
Steady-state heat transfer to boiling liquid helium in simulated coil windings [DE81-028561] N82-15371

CONFERENCES
Aeroelasticity in turbomachines --- conference proceedings [EPFL-ITA-10] N82-15042
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070
Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards [NASA-CP-2196] N82-15095
Groupe Matra Composites Conference --- conference proceedings, Velizy, France, 24 Apr. 1981 N82-15126
Proceedings of the Conference on High-temperature Electronics [NASA-TM-84069] N82-15311
The Third International Cloud Condensation Nuclei Workshop --- conference [NASA-CP-2212] N82-15383
Project DEEP STEAM: Fourth meeting of the technical advisory panel [DE81-029457] N82-15561
Results of the Third International Congress on Noise Effects: As a public health problem; biological disturbances; effects on behavior [BMFT-FB-HA-81-013] N82-15597
Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980 [PB81-244806] N82-15616
Proceedings of the conference on wood combustion environmental assessment [PB81-248155] N82-15622
Symposium proceedings: Environmental aspects of fuel conversion technology, 5th [PB81-245045] N82-15623
Proceedings: Symposium on Flue Gas Desulfurization, volume 1 [PB81-243156] N82-15651
Proceedings: Symposium on Flue Gas Desulfurization, volume 2 [PB81-243164] N82-15652
Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise [PB81-246068] N82-15704
Proceedings of Software Verification and Validation Symposium [PB81-236465] N82-15823
Computer simulation of organic and biological molecules --- conferences [DE81-029948] N82-15871
Technology of controlled nuclear fusion [DE81-027361] N82-15893
Optical Information Processing for Aerospace Applications [NASA-CP-2207] N82-15894
Technical communication. Perspectives for the Eighties, part 2 [NASA-CP-2203-PT-2] N82-15986
Archaeoastronomy in the Americas --- conference [BP-AP-22] N82-16023

CONGRESSIONAL REPORTS
Civil land remote sensing systems [GPO-35-265] N82-15497

CONICAL SHELLS
Localized loads applied to shells of revolution [KFK-CAD-155] N82-15470

CONNECTICUT
Water Resources Data for Connecticut, water year 1980 [PB81-245292] N82-15515

CONSTRUCTION MATERIALS
Workshop on indoor air quality research needs [DE81-026486] N82-15612

CONSUMABLES (SPACECREW SUPPLIES)
STS-1 medical report [NASA-TM-58240] N82-15711
Food and nutrition N82-15724

CONTAINERLESS MELTS
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions [BMFT-FB-W-81-014] N82-15086

CONTAMINANTS
Speciation of aqueous contaminants - role of the geochemical model [DE81-029976] N82-15600
Cabin pollution N82-15760

CONTINUUM MECHANICS
Continuum electron emission in heavy ion: Atom collisons [DE81-028234] N82-15860
Continuum capture in the three-body problem [DE81-025467] N82-15980

CONTOUR SENSORS
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures [DE81-030700] N82-15562

CONTROL
Control of vibration in aeroelastic cascade experiments N82-15056
Solar energy training program for code enforcement personnel [DE81-030053] N82-15563

CONTROL STABILITY
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing [NASA-CR-163115] N82-15074

CONTROLLABILITY
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing [NASA-CR-163115] N82-15074

CONTROLLED FUSION
Hyper-filter-fluorescer spectrometer for fusion X-ray diagnostics [DE81-029867] N82-15425
Survey of atomic physics issues in experimental inertial confinement research [DE81-028389] N82-15874
Progress toward fusion energy [UCRL-84974] N82-15808

CONVECTION
Internal convection under low gravity due to orthogonal gradients of temperature and concentration [BMFT-FB-W-81-041] N82-15069

CONVECTION CLOUDS
Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission [NASA-CR-166752] N82-15408

CONVECTION CURRENTS
Thermal convection simulation in three dimensions by a modified finite element method [DE81-028847] N82-15832

CONVECTIVE FLOW
The behavior of surface wind and thermodynamic fields in the presence of deep convection [AD-A105895] N82-15687

CONVECTIVE HEAT TRANSFER
Heating remote rooms in passive solar buildings [DE81-030247] N82-15248
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas --- estimate of plasma temperature [JUEL-1666] N82-15958

CONVERGENCE
Properties of stochastic labeling procedures --- optimization model [FOA-C-30229-E1] N82-15843

CONVEYORS
Coal and limestone feed testing for atmospheric fluidized bed combustion [DE81-030629] N82-15222

COOLING
Analysis of cooldown performance for ISABELLE helium refrigerator [DE81-030548] N82-15250
Incremental cooling load determination for passive direct gain heating systems [DE81-029882] N82-15575
Transient response of a thermal buffer: A study for ISABELLE [DE81-030549] N82-15950

COOLING SYSTEMS
Comparison of concepts for solar-heated or solar-driven absorption and compression cooling machines for air conditioning and food preservation purposes, phase 1 [BMFT-FB-T-81-165] N82-15541
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE [DE81-030555] N82-15949
MAGCOOL: The production cooling facility for ISABELLE magnets [DE81-030554] N82-15952

COORDINATES
On the choice of suitable operators and parameters in multigrid methods --- for solving elliptic boundary value problems [MC-NW-107/81] N82-15829

COORDINATION POLYMERS
Improved polymers for enhanced oil recovery synthesis and rheology [DE81-030194] N82-15509

COPPER
Time-resolved wave profile measurements in copper to Megabar pressures [DE81-028109] N82-15373
Low temperature diffusion of positive muons in copper [DE81-030255] N82-15973

COPPER ALLOYS
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C [DE81-029780] N82-15189

COPPER COMPOUNDS
Gas cooled electrical leads for use on forced cooled superconducting magnets [DE81-029855] N82-15346

CORIOLIS EFFECT
Validation of predictive tests and countermeasures for space motion sickness N82-15719

CORONARY ARTERY DISEASE
Myocardial perfusion scintigraphy using a new technique, the mesh chamber [DE81-027995] N82-15773

CORPUSCULAR RADIATION
Coulomb explosion of large penetrating molecular clusters [DE81-025866] N82-15861

CORRELATION DETECTION
The signal to noise ratio of a heterodyne laser detection system [PHL-1980-11] N82-15438

CORRELATORS
Interferometric surface-wave acousto-optic time-integrating correlators N82-15905

CORROSION
On the effects of the post-fabrication treatment methods for welded stainless steels [VTT-83] N82-15446
Microbiologic aspects of metal corrosion N82-15764

CORROSION PREVENTION
Ecological and technological problem of biodamages N82-15766

CORROSION RESISTANCE
Development and testing of materials for seawater desalination plants --- corrosion resistant materials [BMFT-FB-M-81-001] N82-15120
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer [BMFT-FB-T-81-138] N82-15134

Corrosion of type 316 stainless steel in molten LiF-LiCl-LiBr
[DE81-028633] N82-15172

Investigation of medium and high temperature phase change materials for thermal energy storage
[BMFT-FB-T-81-149] N82-15536

CORROSION TESTS

Development and testing of materials for seawater desalination plants — corrosion resistant materials
[BMFT-FB-M-81-001] N82-15120

COSMIC RAYS

Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246666] N82-16037

A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039

COSMONAUTS

USSR Space Life Sciences Digest
[NASA-TM-84080] N82-15708

COST ANALYSIS

Cost functions of the long-term planning of digital transmission systems using coaxial cables
[FTZ-FI-03-TBR-14] N82-15267

Community noise assessment manual: Strategy guidelines for developing a community noise control program
[PB81-244352] N82-15642

Quantifying environmental impacts
[PB81-244915] N82-15643

Cost/benefit analysis of implementing LWG FORTRAN compiler/library systems
[DE81-028252] N82-16001

COST ESTIMATES

Development and testing of a low waste nickel plating process
[BMFT-FB-T-81-046] N82-15194

COSTS

High voltage, magnetically switched pulsed power systems
[DE81-026290] N82-15347

Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] N82-15551

COULOMB COLLISIONS

Coulomb explosion of large penetrating molecular clusters
[DE81-025666] N82-15861

Theory of Coulomb distortion of pion spectra by heavy-ion spectator fragments
[DE81-028013] N82-15867

The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885

the 165Ho + 56Fe reaction at E sub lab = 462 MeV N82-15886

COUNTERMEASURES

Validation of predictive tests and countermeasures for space motion sickness N82-15719

COUNTERS

Contribution to CCN Workshop report from University of Wyoming group N82-15384

Description and discussion of the NRL TGDCC N82-15385

The CCN counter of the IOPG of Puy de Dome: Main characterisics and results of measurements N82-15386

UMR dual mode CCN counter (modes: CFD plus haze) N82-15387

Comparison between two Aitken counters and with cloud condensation nuclei counters at the 1980 International CCN Workshop N82-15406

COUNTING

Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

COUPLED MODES

Stability analysis of the twin mode model of coupled flexion/torsion vibrations in turbofans N82-15057

COUPLING

Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946

COVERINGS

Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15376

CRACK INITIATION

Evaluation of the crack initiation life behavior of fatigue loaded automotive components made from high strength aluminum alloys
[DFVLR-FB-81-10] N82-15459

CRACKING (FRACTURING)

In-situ electron microscope fracture studies of amorphous films
[DE81-028141] N82-15971

CREEP ANALYSIS

Finite-element program for creep analysis of concrete structures
[DE81-028071] N82-15460

CREEP PROPERTIES

Effects of misalignment on mechanical behavior of metals in creep
[NASA-CR-165055] N82-15166

Creep recovery and stress relaxation tests of 6061-0 aluminum
[NASA-CR-165056] N82-15167

Stress dependence of creep in Ni bombarded with 17-MeV deuterons
[DE81-030080] N82-15869

CREEP RUPTURE STRENGTH

Study of traction rupture strength of graphite-epoxy composite material laminates T300/5208, with and without a central hole
[REPT-137] N82-15138

CREEP TESTS

Pulsed-irradiation creep in nickel
[DE81-030078] N82-15187

CROP CALENDARS

Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480

US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] N82-15494

CROP INVENTORIES

Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480

Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] N82-15485

Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures — crop acreage estimation
[E82-10013] N82-15491

CROP VIGOR

Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] N82-15492

CROSSBEDDING (GEOLOGY)

Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

CROSSLINKING

Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200

Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201

Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 3: Production engineering
[BMFT-FB-T-81-124-VOL-3] N82-15202

Crosslinking of polyethylene in view of an application in wire coating
[BMFT-FB-T-81-058] N82-15211

Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549

CRYOGENIC EQUIPMENT

Development of cryorefrigerators
[BMFT-FB-T-81-107] N82-15238

Cycle design for the ISABELLE helium refrigerator
[DE81-030551] N82-15249

Production and use of high-grade silicon-diode temperature sensors
[DE81-030547] N82-15424

Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949

MAGCOOL: The production cooling facility for ISABELLE magnets
[DE81-030554] N82-15952

CRYOGENIC FLUID STORAGE

Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117

CRYOGENIC MAGNETS

Heat-load measurement of prototype cryogenic magnets and leads for the ISABELLE project
[DE81-030550] N82-15951

CRYOGENICS

Transient response of a thermal buffer: A study for ISABELLE
[DE81-030549] N82-15950

CRYOPUMPING

Cryopumping of hydrogen and helium
[DE81-030553] N82-15246

CRYPTOGRAPHY

Identifier protection in a distributed operating system
[DE81-025978] N82-15844

CRYSTAL DEFECTS

Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143

Impurity and defect interactions in GaAs
[AD-A106106] N82-15963

Slow positrons in the study of surface and near-surface defects
[DE81-030027] N82-15976

CRYSTAL FILTERS

Electrical screening of integrated circuits by semi-insulating silicon layers
[BMFT-FB-T-81-134] N82-15305

CRYSTAL GROWTH

Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15086

Preparation of Spacelab experiments on Si, CdTe, and ZnS crystal growth during the E1 and D1 missions and construction and testing of a single ellipsoid mirror heating facility
[BMFT-FB-W-81-023] N82-15092

Whatever happened to silicon carbide — semiconductor devices N82-15326

Analytical and numerical model experiments concerning the physics of rock salt formation
[GAMMA-38] N82-15979

CRYSTAL LATTICES

The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15962

Phase transitions and variant actions in lattice gauge theory
[DE81-029324] N82-15977

CRYSTAL STRUCTURE

Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105595] N82-15964

CRYSTALLINITY

Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207

Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549

CRYSTALLIZATION

Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-026330] N82-15154

Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105595] N82-15964

CRYSTALLOGRAPHY

Whatever happened to silicon carbide — semiconductor devices N82-15326

CRYSTALS

Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975

CUMULATIVE DAMAGE

Evaluation of the crack initiation life behavior of fatigue loaded automotive components made from high strength aluminum alloys
[DFVLR-FB-81-10] N82-15459

CURRENT DENSITY
Superconducting critical current density as a probe of defects in metallic glasses
[DE81-028136] N82-15341
Superconducting current densities in bronze-processed Nb3Sn multifilamentary wires
[DE81-030566] N82-15344

CURVE FITTING
NOSS-SCAT wind direction alias removal
[NASA-CR-165069] N82-15660
Theory and implementation of the EOS fitting code RATFIT
[DE81-029110] N82-15831
An algorithm which determines the global least squares equidistant spline fit
[NLR-TR-80006-U] N82-15837

CUSPS (MATHEMATICS)
Low pressure Hugoniot cusp in polymeric materials
[DE81-028267] N82-15204

CUTTERS
Micro-processor-control for cutting machines
[BMFT-FB-T-81-142] N82-15239

CUTTING
Micro-processor-control for cutting machines
[BMFT-FB-T-81-142] N82-15239

CYANATES
Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105595] N82-15964

CYCLIC COMPOUNDS
Stereochemistry of reaction involving cyclic peroxides
[AD-A105999] N82-15146

CYCLOHEXANE
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845

CYCLOTRON RESONANCE
Breakdown in the PRETEXT Tokamak
[DE81-029362] N82-15945

CYCLOTRONS
Constance mirror program: Progress and plans
[NASA-CR-164804] N82-15942
LH wave absorption by mode conversion near ion cyclotron harmonics
[DE81-029434] N82-15947

CYLINDRICAL BODIES
Calculation of the stresses and the finite deflections of a perfect circular cylinder subjected to non-axisymmetric loads
[KFK-CAD-165] N82-15471

CYLINDRICAL CHAMBERS
Design and performance of the new cathode readout proportional chambers in LASS
[DE81-028097] N82-15422

CYLINDRICAL SHELLS
Localized loads applied to shells of revolution
[KFK-CAD-155] N82-15470

CYTOLOGY
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735

CZOCHRALSKI METHOD
Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-028143] N82-15974

D

DAMAGE
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15985

DAMAGE ASSESSMENT
Development of an engineering analysis of progressive damage in composites during low velocity impact
[NASA-CR-165778] N82-15122
Inexact inference for rule-based damage assessment of existing structures
[PB81-235913] N82-15261

DAMPING
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15063
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880

DATA ACQUISITION
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079
Mobile infiltration test unit: Its design and capabilities, preliminary experimental results
[DE81-031927] N82-15245
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter — turbomachinery applications
[MITT-79-04] N82-15429
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495
Reports from the German Meteorological Service. Number 155: Two hundred years of meteorological observations at Hohenpeissenberg (1781-1980)
[ISSN-0072-4130] N82-15675
Medical information management N82-15730
Definitions of CAMAC terms
[DE81-028247] N82-15801
Using microcomputers to monitor the field performance of residential heat pumps
[PB81-240606] N82-15806

DATA BASE MANAGEMENT SYSTEMS
OSTA/ADS standards development process N82-15098
ADS pilot methodologies as candidates for ADS standards N82-15100
Panel A report: Standards needed to interconnect ADS pilots for data sharing for catalogues, directories, and dictionaries N82-15101
Panel B report: Standards needed to interconnect ADS pilots for data sharing for user interfaces N82-15102
Panel C report: Standards needed for the use of ISO Open Systems Interconnection - basic reference model N82-15103
Panel D report: Standards needed to interconnect ADS pilots for data sharing in data formats and descriptions N82-15104
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 2: Knowledge base
[AD-A106103] N82-15285
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] N82-15506
Impact of weather and climate on agriculture: A selected bibliography
[PB81-245003] N82-15696
University of Washington nuclear physics data collection system
[DE81-028321] N82-15889
A Workshop on Qualitative Information Retrieval
[AD-A105897] N82-16000
Self-describing data file structure for large data sets
[DE81-027997] N82-16004
Managing large-scale models: DBS
[DE81-028683] N82-16006

DATA BASES
Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards
[NASA-CP-2196] N82-15095
Propagation data bases N82-15274
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 3: Program source files
[AD-A106104] N82-15286
Implementation and application of a set theoretical data base system
[BMFT-FB-DV-81-004] N82-15797
GRAD: A tool for program analysis and progress monitoring
[DE81-028096] N82-15981
Data editing on large data sets
[DE81-028022] N82-16002
Preliminary internal data screening: A component of quantitative data analysis in data validation
[CONF-810842-1] N82-16005

DATA COLLECTION PLATFORMS
Analysis of Meteorological Satellite location and data collection system concepts
[NASA-CR-166763] N82-15679

DATA CORRELATION
Correlation of transonic-cone Preston-tube data and skin friction — characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019

DATA LINKS
Characteristics of rain and rain systems N82-15271
Fault detection and surveillance for a link in a data transmission network
[ENST-D-80010] N82-15289

DATA MANAGEMENT
Role of engineering judgement and the computer in the management of material property data
[DE81-028830] N82-15962

DATA PROCESSING
Data evaluation and data processing of the low-energy particle spectrometer E8 on board the HELIOS probes
[BMFT-FB-W-81-035] N82-15416
Calibration and data correction procedures for flow meters and pressure transducers commonly used by the Coastal Studies Unit
[AD-A105594] N82-15418
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480
ERSYS-SPP access method subsystem design specification
[E82-10015] N82-15493
Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15658
Short system descriptions
[KFK-PDV-126] N82-15821
Analysis of responses to survey of DTIC's military users on current and planned technical library/information center automation
[AD-A105507] N82-15999

DATA RECORDING
Digital recording of video signals on magnetic tape at 40 M bit/sec
[BMFT-FB-T-81-064] N82-15410
Federal records management: A history of neglect
[PB81-237133] N82-15683

DATA REDUCTION
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] N82-15484

DATA SAMPLING
Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures — crop acreage estimation
[E82-10013] N82-15491
Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] N82-15499

DATA STORAGE
Self-describing data file structure for large data sets
[DE81-027997] N82-16004

DATA SYSTEMS
OSTA data systems planning workshop recommendations N82-15096
The role of pilots N82-15097
Overview of the current MITRE effort N82-15099
Data protection of computer aided telecommunication systems
[BMFT-FR-DV-81-006] N82-15282
On data security in a distributed office computer system
[FOA-C-30224-E1] N82-15825
University of Washington nuclear physics data collection system
[DE81-028321] N82-15889

DATA TRANSMISSION
The role of pilots N82-15097
Information capacity of Gaussian channels
[AD-A105659] N82-15283

Technology related investigations of hardware variations depending on system proposals and new approaches to decoders for Videotext-Bildschirmtext
[BMFT-FB-T-81-024] N82-15791
Specifications of Sandia prototype network communications interface between applications software and NSC A120 adapters
[DE81-028461] N82-15824
Transparent GaAlAs luminescent diodes for optical wavelength multiplexing
[BMVG-FBWT-79-18] N82-15938

DECELERATION
Harmfulness of violent impact and airflow shocks N82-15742

DECISION MAKING
Role of large scale energy systems models in R&D planning
[DE81-026056] N82-15543
Quantifying environmental impacts
[PB81-244915] N82-15643
Role of engineering judgement and the computer in the management of material property data
[DE81-028630] N82-15982
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013

DECODERS
Integrated filter for video color processing
[BMFT-FB-T-81-065] N82-15300
Technology related investigations of hardware variations depending on system proposals and new approaches to decoders for Videotext-Bildschirmtext
[BMFT-FB-T-81-024] N82-15791

DECOMPOSITION
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229

DECOMPRESSION SICKNESS
The physiological effect of low-air-pressure anoxia N82-15748
Caisson disease N82-15749
Dangers of explosive decompression N82-15750

DECONTAMINATION
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236481] N82-15645
Ultraviolet disinfection of a secondary wastewater treatment plant effluent
[PB81-242125] N82-15648
Shuttle toxicology N82-15726

DEEPWATER TERMINALS
Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

DEER
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10016] N82-15496

DEFECTS
Superconducting critical current density as a probe of defects in metallic glasses
[DE81-026136] N82-15341

DEFLECTION
Calculation of the stresses and the finite deflections of a perfect circular cylinder subjected to non-axisymmetric loads
[KFK-CAD-165] N82-15471
Possible applications of the steering of charged particles by bent single crystals
[DE81-026601] N82-15966

DEFORESTATION
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490

DEGRADATION
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-236578] N82-15148
Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926

DEGREES OF FREEDOM
Hysteresis identification of multi-story buildings
[PB81-235921] N82-15260

DELTA LAUNCH VEHICLE
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107

DELTA WINGS
Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report)
[NASA-CR-165806] N82-15014

DEMAND (ECONOMICS)
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] N82-15605

DEMODULATORS
A 16 QAM modem for a 140 Mbit/sec radio relay system
[FTZ-FI-21-TBR-20] N82-15269

DENSIFICATION
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264

DENSITY (MASS/VOLUME)
Heating oils, 1981
[DE81-030633] N82-15223
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705

DEOXYRIBONUCLEIC ACID
Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734

DEPENDENCE
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15189

DEPLETION
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229

DEPOLARIZATION
Depolarization on Earth-space paths N82-15273

DEPTH MEASUREMENT
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] N82-15661
Laser depth sounding in the Baltic Sea — from airplanes
[FOA-C-30219-E1] N82-15702

DESALINIZATION
Development and testing of materials for seawater desalination plants — corrosion resistant materials
[BMFT-FB-M-81-001] N82-15120

DESIGN ANALYSIS
Development of the ARIES parachute system
[NASA-TM-84082] N82-15023
Helicopter landing gear design and test criteria investigation
[AD-A105612] N82-15035
System analysis approach to deriving design criteria (Loads) for Space Shuttle and its payloads. Volume 2: Typical examples
[NASA-TP-1950] N82-15106
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114
Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247
Ruggedized electronographic tube development
[NASA-CR-166762] N82-15297
Development of force-cooled superconductors for use in large magnets
[DE81-028067] N82-15343
Using a TEM (Transverse Electromagnetic) cell for EMC measurements of electronic equipment
[PB81-244857] N82-15356
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012

DESULFURIZING
Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product — ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142
Coal resources and sulphur emission regulations: A summary of 6 eastern and midwestern states
[PB81-240319] N82-15614
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029653] N82-15667
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610
Use of coal cleaning for compliance with SO2 emission regulations
[PB81-247520] N82-15616
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] N82-15651
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15652

DETONATION
High-explosive detonations in varying-oxygen atmospheres
[DE81-026179] N82-15228
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229

DEUTERIUM
The mass spectra and isotopic purity of compounds proposed for use in the master analytical scheme for the analysis of organic compounds in water
[PB81-238453] N82-15163
Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15972

DEVELOPING NATIONS
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590

DIAGNOSIS
Remote Medical Diagnosis System (RMDS) utilization study
[AD-A105559] N82-15771

DIELECTRIC PROPERTIES
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15208

DIELECTRICS
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
Investigation of semiconductor clad optical waveguides
[NASA-CR-165074] N82-15276
Development of an 1100 deg F capacitor N82-15315
High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333
Performance and cost analysis of large capacitor banks using Weibull statistics and MTBF
[DE81-024364] N82-15342
Four- and five-layer silicon-clad dielectric waveguides N82-15911

DIESEL ENGINES
Survey of proposed methods of burning alcohol in diesel engines
[DE81-025834] N82-15219
The utilisation of alcohol in light duty diesel engines
[PB81-244469] N82-15452

DIESEL FUELS
Survey of proposed methods of burning alcohol in diesel engines
[DE81-025834] N82-15219
Characterization of diesel emissions as a function of fuel variables
[PB81-244046] N82-15233

DIFFERENCE EQUATIONS
A heat transfer analysis of scald injury
[PB81-236503] N82-15777

DIFFERENTIAL EQUATIONS
Introduction to the calculation of parametrically excited oscillations
[ISBN-3-7983-5150-3] N82-15294
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826

DIFFRACTION
Manipulation of light with magneto-optic stripe domain fields N82-15922

DIFFRACTION LIMITED CAMERAS
The Faint Object Camera (FOC): European instrument associated with the space telescope N82-15431

DIFFRACTION PATTERNS
Dynamics of hadron-nucleus interactions
[DE81-026272] N82-15856

DIFFRACTOMETERS
Instrument for liquids, amorphous and power diffraction
[DE81-030135] N82-15421

DIFFUSE RADIATION
Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773

DIFFUSION
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics N82-15335
Analysis of column tracer experiments by a stochastic-convective transport method
[DE81-030088] N82-15375
On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15694
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826

DIFFUSION COEFFICIENT
Computer simulation of bulk and surface chemical diffusion of light atoms in metals
[DE81-025159] N82-15175
Tracer investigations of the laws governing the migration of phlegmatizers in gun propellants
[BMVG-FBWT-81-7] N82-15215
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310

DIFLUORIDES
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446

DIGITAL COMPUTERS
Role of optical computers in aeronautical control applications N82-15897

DIGITAL DATA
Digital recording of video signals on magnetic tape at 40 M bit/sec
[BMFT-FB-T-81-064] N82-15410
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] N82-15485

DIGITAL FILTERS
Integrated filter for video color processing
[BMFT-FB-T-81-065] N82-15300
Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834
Optical recognition of statistical patterns N82-15907

DIGITAL INTEGRATORS
Interferometric surface-wave acousto-optic time-integrating correlators N82-15905
Optical Spatial integration methods for ambiguity function generation N82-15908

DIGITAL SYSTEMS
Integration of a digital air data computer into the test aircraft HFB-320
[DFVLR-MITT-81-09] N82-15036
Attenuation of coaxial pairs in the lower frequency range
[FTZ-FI-21-TBR-51] N82-15266
Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295
Energy normalization of TV viewed optical correlation (automated correlation plane analyzer for an optical processor) N82-15903
Three methods for performing Hankel transforms N82-15906

DIGITAL TECHNIQUES
An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156883] N82-15676

DIGITAL TO ANALOG CONVERTERS
Hybrid A/D converter for 200 deg C operation N82-15329

DIMENSIONAL MEASUREMENT
Some considerations regarding film thickness standards for the semiconductor industry
[PB81-239535] N82-15357
Development of a measuring, control, and regulation unit for a cylinder turning machine
[BMFT-FB-T-81-106] N82-15450

DIMENSIONAL STABILITY
Thermomechanical response of Gr/PI composites
[NASA-CR-165753] N82-15124

DIODES
Control of the minority carrier lifetime of silicon devices using electron irradiation
[BMFT-FB-T-81-097] N82-15349
Laser diode
[BMFT-FB-T-81-151] N82-15439

DIRECTIONAL SOLIDIFICATION (CRYSTALS)
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072
Application of skin technology: TEXUS 2 experiment
[BMFT-FB-W-81-028] N82-15087

DIRICHLET PROBLEM
On the regularity of the principle value of the double layer potential — the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828

DISCRIMINATION
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850

DISKS (SHAPES)
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310

DISPERSING
Formation and spreading of explosive and toxic gas clouds. A study of the literature
[FOA-C-40141-C1] N82-15379
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028669] N82-15602
Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654

DISPLACEMENT
Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-028603] N82-15171

DISPLAY DEVICES
On two-six thin film technology for the preparation of active luminescing areas
[BMFT-FB-T-81-115] N82-15144
Electrochromic displays
[BMFT-FB-T-81-141] N82-15306
Design and performance of the new cathode readout proportional chambers in LASS
[DE81-028097] N82-15422
Summary of the Graphic Information Display Session
[DE81-028231] N82-16003

DISPOSAL
A criterion for the disposal of M56 sleeping bags
[IZF-1979-15] N82-15782

DISSOLVING
Dissolution of surface oxide layers on titanium and titanium subhydride between 25 and 700 C
[DE81-028044] N82-15136

DISTANCE
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111

DISTILLATION
Development of an Na distillation process for re-refining waste oil in order to avoid environment pollution. Phase 1: Preliminary tests in Bern
[BMFT-FB-T-81-034] N82-16016

DISTRIBUTED PARAMETER SYSTEMS
Study of the structure of a process control system consisting of units for signal processing, operator stations and process computer
[BMFT-FB-T-81-135] N82-15280

DISTRIBUTION MOMENTS
Stability measuring and dispersion of shells with different lengths of low aerodynamic drag tip
[FOA-C-20418-D2] N82-15022

DIURNAL VARIATIONS
Global ocean tides. Part 7: The diurnal principal solar tide (P1), atlas of tidal charts and maps
[AD-A105612] N82-15700

DOCUMENT STORAGE
Electronic picture base
[BMFT-FB-DV-81-005] N82-15796

DOCUMENTATION
Trends in liability affecting technical writers N82-15996

DOCUMENTS
Indian energy abstracts
[PB81-232316] N82-15591

DOMESTIC ENERGY
Heating oils, 1981
[DE81-030833] N82-15223
Annual report to the President and the Congress on the State Energy Conservation Program for calendar year 1980
[DE81-025862] N82-15554

DOPED CRYSTALS
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826
Impurity and defect interactions in GaAs
[AD-A106108] N82-15963

DOSIMETERS
Radiological health N82-15727

DRAG MEASUREMENT
Thermospheric studies using satellites AEROS A and B — atmospheric total density determination by the orbital drag technique
[BMFT-FB-W-81-012] N82-15667

DRAG REDUCTION
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

DRAINAGE PATTERNS
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] N82-15486
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519
Experimental design and data of the August 1980 Corral Gulch nocturnal wind experiment, Piceance Basin, northwestern Colorado
[DE81-028665] N82-15690

DRIFT RATE
A two dimensional position sensitive deltaE-E counter for energetic light charged particles N82-15862

DRILLING
System analysis of alternative procedures for deep drilling technique for depth between 6,000 and 10,000 meters
[BMFT-FB-T-81-067] N82-15237

DROP SIZE
MRI airborne research studies in support of HIPLEX
[PB81-243750] N82-15695

DROPS (LIQUIDS)
Sound damping in a condensation loaded gas flow
[MPIS-24/1980] N82-15852

DUALITY THEOREM
Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

DUCT GEOMETRY
Application of steady state finite element and transient finite difference theory to sound propagation in a variable area duct: A comparison with experiment
[NASA-TM-82678] N82-15847
DUCTED FLOW
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850
DUST
Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031
DYNAMIC CHARACTERISTICS
Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165067] N82-15032
Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473
DYNAMIC LOADS
System analysis approach to deriving design criteria (Loads) for Space Shuttle and its payloads. Volume 2: Typical examples
[NASA-TP-1950] N82-15106
Pressure-shear loading of materials
[DE81-026250] N82-15482
DYNAMIC MODELS
Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248
Phonons in graphite intercalation compounds measured by neutron scattering
[DE81-029681] N82-15868
DYNAMIC PROGRAMMING
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013
DYNAMIC RESPONSE
Estimation methods for the determination of dynamic responses of elastic aircraft — to random loads
[BMVG-FBWT-81-6] N82-15037
A method for force determination from vibration response measurements — application to turbomachine blades N82-15055
Vertical motion of highway bridge structure due to an earthquake
[PB81-235319] N82-15254
DYNAMIC STRUCTURAL ANALYSIS
Structural safety analysis of proposed Harpoon test facility
[PML-1979-74] N82-15105
Hysteresis identification of multi-story buildings
[PB81-235921] N82-15260
Experimental and theoretical study of a tall building subjected to wind loading
[DE81-029478] N82-15465
Using the envelope of resonance peaks to estimate power absorbed by a finite structure — vibration
[ISVR-TR-115] N82-15472

E

EAR PROTECTORS
Hearing protection
[IZF-1980-2] N82-15783
The sound attenuation of the Willson earmuff number 250 and the Amplivox, type H4016
[IZF-1979-9] N82-15849
EARPHONES
The sound attenuation of the Willson earmuff number 250 and the Amplivox, type H4016
[IZF-1979-9] N82-15849
EARTH ATMOSPHERE
Transmission and emission of the atmosphere; continued measurements and analysis of the data
[PHL-1979-50] N82-15855
Environmental conditions of aviation and space navigation N82-15736
EARTH AXIS
Dimensions, volume 65, number 3
[PB81-238063] N82-15436
EARTH CRUST
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
EARTH MOVEMENTS
Probabilistic analysis for liquefaction
[PB81-249724] N82-15263
Water waves generated by three dimensional bed motion: Abstract
[PB81-236172] N82-15674
EARTH OBSERVATIONS (FROM SPACE)
Meteorological satellites
[AD-A107427] N82-15110
Civil land remote sensing systems
[GPO-35-265] N82-15497
EARTH RESOURCES
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] N82-15225
Research programme 1981/82 — water science N82-15474
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] N82-15508
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] N82-15925
EARTH RESOURCES INFORMATION SYSTEM
Civil land remote sensing systems
[GPO-35-265] N82-15497
EARTHQUAKE DAMAGE
Vertical motion of highway bridge structure due to an earthquake
[PB81-235319] N82-15254
EARTHQUAKE RESISTANCE
Hysteresis identification of multi-story buildings
[PB81-235921] N82-15260
EARTHQUAKE RESISTANT STRUCTURES
Inexact inference for rule-based damage assessment of existing structures
[PB81-235913] N82-15261
ECOLOGY
USSR report: Earth sciences, no. 16
[JPRS-79631] N82-15476
Model of Climate and Global Ecology N82-15477
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] N82-15496
Studies of the effects of operating the Mt. Elbert Pumped-Storage Powerplant on Twin Lakes, Colorado: 1979 report of findings
[PB81-240483] N82-15521
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] N82-15598
Assessment report on the effects of waste dumping in 106-mile ocean waste disposal site: Dumpsite evaluation report
[PB81-241572] N82-15650
Environmental effects of shuttle launch and landing N82-15729
Ecological and technological problem of biodamages N82-15766
ECONOMIC ANALYSIS
Individual biomass facility reports. Supplement to some employment and earnings implications of regional biomass energy utilization: New England and the Cornbelt States
[DE81-028523] N82-15550
Moorhead district heating, phase 2
[DE81-029689] N82-15556
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15560
Micro-hydropower in the United States
[DE81-028271] N82-15567
Methodology and basic algorithms of the Livermore Economic Modeling Systems
[DE81-029430] N82-15833
ECONOMIC DEVELOPMENT
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
Technique for planning and managing industrial growth from the air-quality standpoint
[DE81-026342] N82-15614
ECONOMIC FACTORS
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] N82-15589
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
ECONOMIC IMPACT
Individual biomass facility reports. Supplement to some employment and earnings implications of regional biomass energy utilization: New England and the Cornbelt States
[DE81-028524] N82-15550
ECONOMICS
The influence of aeronautical R&D expenditures upon the productivity of air transportation
[PB81-247140] N82-15984
ECOSYSTEMS
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] N82-15598
EDDY CURRENTS
EDDY: A program for calculating the behavior of electromagnets
[KFK-CAD-168] N82-15302
EDITING
Data editing on large data sets
[DE81-028022] N82-16002
EDITING ROUTINES (COMPUTERS)
EDITEX: A telex text-editor based on an 8085 microprocessor
[PHL-1980-06] N82-15795
Functional description of the ISIS system
[NASA-CR-159152] N82-15814
EDUCATION
Technical communication. Perspectives for the Eighties, part 2
[NASA-CP-2203-PT-2] N82-15986
Technical writing versus technical writing N82-15988
Whys and hows of in-house writing N82-15989
Technical writing practically unified through industry N82-15990
EFFECTIVE PERCEIVED NOISE LEVELS
Cabin acoustical noise N82-15728
EFFECTS
Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024
EIGENVALUES
Elements for the numerical analysis of wave motion in layered media
[PB81-245266] N82-15292
The construction of an accurate lower bound for the real parts of the eigen values of an M-matrix
[MC-NW-102/81] N82-15827
Statistical description of an attractor
[DE81-027706] N82-15330
EJECTION
Harmfulness of violent impact and airflow shocks N82-15742
EJECTION SEATS
Harmfulness of violent impact and airflow shocks N82-15742
ELASTIC BENDING
Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455
ELASTIC PLATES
Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455
ELASTIC PROPERTIES
Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178
ELECTRIC ARCS
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965
ELECTRIC BATTERIES
The electrochemistry of molten lithium chlorate and its possible use with lithium in a battery
[AD-A106666] N82-15145
ELECTRIC CONDUCTORS
High temperature (Al2O3) insulation and light weight conductors N82-15337
Gas cooled electrical leads for use on forced cooled superconducting magnets
[DE81-029655] N82-15346
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965

ELECTRIC CONTACTS
Ohmic contacts to GaAs for high-temperature device applications N82-15319
Monitoring techniques for carbon fiber emissions: Evaluation B
[PB81-247413] N82-15619

ELECTRIC ENERGY STORAGE
Energy storage systems for terrestrial solar generators — cadmium/mercury oxide cells
[BMFT-FB-T-81-062] N82-15529

ELECTRIC EQUIPMENT TESTS
Testing results of MF-Nbsub3Sn
[DE81-026632] N82-15135

ELECTRIC FIELDS
Dimensions, volume 65, number 3
[PB81-235053] N82-15436

ELECTRIC MOTOR VEHICLES
Development of the aluminum-air battery for electric vehicle applications
[DE81-028446] N82-16010
Feasibility of electric vehicles in New Zealand
[DE81-903684] N82-16011

ELECTRIC MOTORS
On the efficiency of small air coil motors
[WTHD-131] N82-15303
Design of a reluctance motor with increased efficiency and power factor for widespread industrial application
[BMFT-FB-T-81-157] N82-15308

ELECTRIC POTENTIAL
Journal of research of the National Bureau of Standards. Volume 86, no. 4, July - August 1981
[PB81-247017] N82-15164
Nickel-iron battery of high energy density
[BMFT-FB-T-81-100] N82-15531

ELECTRIC POWER PLANTS
Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines N82-15193
Studies of the effects of operating the Mt. Elbert Pumped-Storage Powerplant on Twin Lakes, Colorado: 1979 report of findings
[PB81-240483] N82-15521
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610
Quantifying environmental impacts
[PB81-244915] N82-15643
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013

ELECTRIC POWER TRANSMISSION
Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339
Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345

ELECTRIC PULSES
Development of power system measurements
[PB81-246860] N82-15355

ELECTRIC ROCKET ENGINES
Electrothermal hydrazine thruster
[BAE-RPT/EHT/40212-VOL-1] N82-15118

ELECTRIC WIRE
Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201
Crosslinking of polyethylene in view of an application in wire coating
[BMFT-FB-T-81-058] N82-15211

ELECTRICAL FAULTS
Development of power system measurements
[PB81-246860] N82-15355
Breakdown in the PRETEXT Tokamak
[DE81-029362] N82-15945

ELECTRICAL GROUNDING
Development of tests and criteria to evaluate grounding systems
[PB81-238354] N82-15522

ELECTRICAL INSULATION
Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 3: Production engineering
[BMFT-FB-T-81-124-VOL-3] N82-15202
Crosslinking of polyethylene in view of an application in wire coating
[BMFT-FB-T-81-058] N82-15211
Electrical screening of integrated circuits by semi-insulating silicon layers
[BMFT-FB-T-81-134] N82-15305
High temperature (Al2O3) insulation and light weight conductors N82-15337

ELECTRICAL MEASUREMENT
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] N82-15336

ELECTRICAL PROPERTIES
Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143
Topography of the electrical properties of the silicon/oxide interface and the influence of technologic treatments
[BMFT-FB-T-81-066] N82-15301
Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557
Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-028143] N82-15974

ELECTRICAL RESISTANCE
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15168

ELECTRICAL RESISTIVITY
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15208

ELECTRO-OPTICS
Ruggedized electronographic tube development
[NASA-CR-166762] N82-15297
High temperature electronic requirements in aeropropulsion systems
[E-706] N82-15313
Applications of electro-optic gratings in integrated optical signal processing devices N82-15910
CO2 laser waveguiding in proton implanted GaAs N82-15912
Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926

ELECTROCATALYSTS
Chemically modified electrodes for electrocatalysis
[AD-A105563] N82-15147

ELECTROCHEMICAL OXIDATION
Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154

ELECTROCHEMISTRY
Physical properties data compilations relevant to energy storage. 4: Molton Salts: Data on additional single and multi-component salt systems
[PB81-244121] N82-15162
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310

ELECTRODEPOSITION
Development of a thin film preparation technique for ZrO2(Y2O3) electrolytes on porous support structures
[BMFT-FB-T-81-143] N82-15307

ELECTRODES
Chemically modified electrodes for electrocatalysis
[AD-A105563] N82-15147
Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154
Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310
Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes
[BMFT-FB-T-81-053] N82-15585

ELECTROLUMINESCENCE
On two-six thin film technology for the preparation of active luminescing areas
[BMFT-FB-T-81-118] N82-15144

ELECTROLYSIS
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15168

ELECTROLYTES
The electrochemistry of molten lithium chlorate and its possible use with lithium in a battery
[AD-A105968] N82-15145
Development of a thin film preparation technique for ZrO2(Y2O3) electrolytes on porous support structures
[BMFT-FB-T-81-143] N82-15307
Development of the aluminum-air battery for electric vehicle applications
[DE81-028446] N82-16010

ELECTROLYTIC CELLS
Nickel-iron battery of high energy density
[BMFT-FB-T-81-100] N82-15531

ELECTROMAGNETIC ACCELERATION
Electromagnetic launcher: A new weapon
[DE81-029979] N82-15287

ELECTROMAGNETIC COMPATIBILITY
Using a TEM (Transverse Electromagnetic) cell for EMC measurements of electronic equipment
[PB81-244857] N82-15356

ELECTROMAGNETIC MEASUREMENT
Using a TEM (Transverse Electromagnetic) cell for EMC measurements of electronic equipment
[PB81-244857] N82-15356
Transmission and emission of the atmosphere; continued measurements and analysis of the data
[PHL-1979-50] N82-15655

ELECTROMAGNETIC SHIELDING
Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295

ELECTROMAGNETIC WAVE TRANSMISSION
Present possibilities for the use of microwaves in civil engineering: Bibliographical study
[LBC-95] N82-15235
Transmission and emission of the atmosphere; continued measurements and analysis of the data
[PHL-1979-50] N82-15655

ELECTROMAGNETS
EDDY: A program for calculating the behavior of electromagnets
[KFK-CAD-168] N82-15302

ELECTRON ACCELERATORS
Status of the free-electron laser experiment at Los Alamos
[DE81-030132] N82-15441
Evaluation of infrared simulation data
[AD-A105672] N82-15931

ELECTRON BEAM WELDING
COST 50: Materials for gas turbines N82-15071

ELECTRON BEAMS
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201
Electron irradiation of semiconductor devices
[BMFT-FB-T-81-045] N82-15350
Photolithographic processes for small structures: Introduction and trial of electron beam lithography
[BMFT-FB-T-80-199] N82-15430

Compact 36 kJ electron beam system for laser pumping
[DE81-024375] N82-15440
Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549
Continuously variable electrooptic filter
[DE81-028363] N82-15934
ELECTRON CAPTURE
Continuum capture in the three-body problem
[DE81-028467] N82-15980
ELECTRON DISTRIBUTION
Impedance probe: The electron density experiment onboard the aeronomy satellites AEROS
[BMFT-FB-W-81-006] N82-15670
ELECTRON EMISSION
Continuum electron emission in heavy ion: Atom collisons
[DE81-028234] N82-15860
ELECTRON ENERGY
Parameterization of the bremsstrahlung spectrum
[DE81-029739] N82-15859
ELECTRON IRRADIATION
Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 3: Production engineering
[BMFT-FB-T-81-124-VOL-3] N82-15202
Control of the minority carrier lifetime of silicon devices using electron irradiation
[BMFT-FB-T-81-037] N82-15349
Electron irradiation of semiconductor devices
[BMFT-FB-T-81-045] N82-15350
ELECTRON MICROSCOPES
Systems background in X-ray microanalysis
[DE81-027296] N82-15420
In-situ electron microscope fracture studies of amorphous films
[DE81-028141] N82-15971
ELECTRON MICROSCOPY
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-15199
ELECTRON PARAMAGNETIC RESONANCE
Microanalysis by electron-spinning spectrometer for material and process control in semiconductor technology
[BMFT-FB-T-80-193] N82-15160
ELECTRON RADIATION
Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549
ELECTRON SCATTERING
Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15972
ELECTRON SPECTROSCOPY
Microanalysis by electron-spinning spectrometer for material and process control in semiconductor technology
[BMFT-FB-T-80-193] N82-15160
Ultra-high-Vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419
ELECTRON TRANSFER
Chemically modified electrodes for electrocatalysis
[AD-A105563] N82-15147
ELECTRON TUNNELING
Journal of research of the National Bureau of Standards. Volume 86, no. 4, July - August 1981
[PB81-247017] N82-15164
ELECTRONIC CONTROL
Development on a new kind of microprocessor-based lock
[BMFT-FB-T-81-129] N82-15794
Electronic picture base
[BMFT-FB-DV-81-005] N82-15796
ELECTRONIC EQUIPMENT TESTS
Using a TEM (Transverse Electromagnetic) cell for EMC measurements of electronic equipment
[PB81-244857] N82-15356
Fine-grained hodoscopes based on scintillating optical fibers
[DE81-029316] N82-15935
ELECTRONIC MODULES
Compact 36 kJ electron beam system for laser pumping
[DE81-024375] N82-15440
ELECTRONIC PACKAGING
Proceedings of the Conference on High-temperature Electronics
[NASA-TM-84089] N82-15311
A presently available energy supply for high temperature environment (550-1000 deg F)
N82-15334
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335
Packaging techniques for low-altitude Venus balloons beacon N82-15336
High temperature (Al2O3) insulation and light weight conductors N82-15337
ELECTRONIC TRANSDUCERS
Optical Spatial integration methods for ambiguity function generation N82-15908
ELECTROPLATING
Development and testing of a low waste nickel plating process
[BMFT-FB-T-81-046] N82-15194
ELECTROSTATIC PROBES
The AEROS retarding potential analyzer --- for ionospheric plasma parameter determination
[BMFT-FB-W-81-007] N82-15666
ELEMENTARY PARTICLE INTERACTIONS
Numerical studies of gauge field theories
[DE81-030526] N82-15846
ELLIPTIC DIFFERENTIAL EQUATIONS
On the choice of suitable operators and parameters in multigrid methods --- for solving elliptic boundary value problems
[MC-NW-107/81] N82-15829
EMBRITTLEMENT
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
EMERGENCIES
Emergency Medical Services System (EMSS)
N82-15716
EMISSION
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514
EMPLOYMENT
Individual biomass facility reports. Supplement to some employment and earnings implications of regional biomass energy utilization: New England and the Cornbelt States
[DE81-028523] N82-15550
ENDOCRINE SYSTEMS
Biochemistry and endocrinology results
N82-15721
ENDOTHERMIC REACTIONS
Effects of reagent translational and vibrational energy on the dynamics of endothermic reactions
[DE81-028122] N82-15969
ENERGETIC PARTICLES
Energetic particles flux experiment for ISEE mother/daughter spacecraft
[NASA-CR-166761] N82-16026
ENERGY ABSORPTION
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] N82-15661
ENERGY CONSERVATION
Selected advanced aerodynamic and active control concepts development
[NASA-CR-3220] N82-15033
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028696] N82-15242
Mobile infiltration test unit: Its design and capabilities, preliminary experimental results
[DE81-031927] N82-15245
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] N82-15453
Annual report to the President and the Congress on the State Energy Conservation Program for calendar year 1980
[DE81-025662] N82-15554
Summary of passive solar multi-family design workshops
[DE81-030353] N82-15564
Passive-solar retrofit study for the United States Navy
[DE81-030250] N82-15574
ENERGY CONSUMPTION
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028696] N82-15242
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] N82-15553
Annual report to the President and the Congress on the State Energy Conservation Program for calendar year 1980
[DE81-025662] N82-15554
Technology change and energy consumption: A comparison of residential subdivisions
[DE81-030075] N82-15555
Micro-hydropower in the United States
[DE81-028271] N82-15567
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] N82-15571
Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] N82-15583
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
Fuels and electric energy consumed
[PB81-240442] N82-15594
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] N82-15805
ENERGY CONVERSION
Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] N82-15553
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592
Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] N82-15623
ENERGY DISSIPATION
Continuum electron emission in heavy ion: Atom collisons
[DE81-028234] N82-15860
Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880
Dissipative reaction dynamics of heavy-ion collisions N82-15881
ENERGY DISTRIBUTION
Performance and cost analysis of large capacitor banks using Weibull statistics and MTBF
[DE81-024364] N82-15342
Kinetic theory of Alfven wave heating
[DE81-029777] N82-15582
Energy analysis of fast ions from plasma focus discharges
[IPF-80-11] N82-15980
ENERGY LEVELS
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15867
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15876
Heavy-ion fusion revisited N82-15884
ENERGY METHODS
Role of large scale energy systems models in R&D planning
[DE81-026058] N82-15543
ENERGY OF FORMATION
Heavy-ion fusion revisited N82-15884

ENERGY POLICY
High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] N82-15536
Role of large scale energy systems models in R&D planning
[DE81-026056] N82-15543
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544
Annual report to the President and the Congress on the State Energy Conservation Program for calendar year 1980
[DE81-025662] N82-15554
Technology change and energy consumption: A comparison of residential subdivisions
[DE81-030075] N82-15555
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576
Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] N82-15583
Indian energy abstracts
[PB81-232316] N82-15591
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15652
Methodology and basic algorithms of the Livermore Economic Modeling Systems
[DE81-029430] N82-15833
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013
ENERGY REQUIREMENTS
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] N82-15589
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
ENERGY SOURCES
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] N82-15589
Energy and development in Central America. Volume 2: Country assessments
[PB81-231557] N82-15590
ENERGY STORAGE
Physical properties data compilations relevant to energy storage. 4: Molton Salts: Data on additional single and multi-component salt systems
[PB81-244121] N82-15162
A presently available energy supply for high temperature environment (550-1000 deg F)
N82-15334
Reservoir stability studies
[DE81-030099] N82-15510
Compressed-air energy-storage technology: Program overview
[DE81-030103] N82-15548
Experimental study for rechargeable sealed Ni/Cd watch batteries
[BMFT-FB-T-81-129] N82-15586
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592
ENERGY TECHNOLOGY
An assessment of nonfossil hydrogen
[PB81-246522] N82-15231
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] N82-15542
Role of large scale energy systems models in R&D planning
[DE81-026056] N82-15543
Solar energy training program for code enforcement personnel
[DE81-030053] N82-15563
Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-026052] N82-15572
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029683] N82-15578
Indian energy abstracts
[PB81-232316] N82-15591
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592
Methodology and basic algorithms of the Livermore Economic Modeling Systems
[DE81-029430] N82-15833
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] N82-16014
ENERGY TRANSFER
Aerodynamic response of a blade in pitching oscillation with partial and full separation — measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel N82-15047
ENGINE CONTROL
Role of optical computers in aeronautical control applications N82-15897
ENGINE DESIGN
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041
ENGINE MONITORING INSTRUMENTS
High temperature electronic requirements in aeropropulsion systems
[E-708] N82-15313
ENGINEERING
International Business Machines, Inc., System/38 COBOL, 5714-CB1 Release 2
[PB81-249104] N82-15809
ENGINEERING MANAGEMENT
Role of engineering judgement and the computer in the management of material property data
[DE81-028630] N82-15982
A case study of the influences of audience and purpose on the composing processes of an engineer N82-15992
ENVIRONMENT EFFECTS
Studies of the effects of operating the Mt. Elbert Pumped-Storage Powerplant on Twin Lakes, Colorado: 1979 report of findings
[PB81-240483] N82-15521
Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] N82-15598
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599
Proceedings of the conference on wood combustion environmental assessment

Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-238962] N82-15632
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243008] N82-15634
Community noise assessment manual: Social survey workbook
[PB81-244360] N82-15635
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637
Review and update of modeling analysis of carbon monoxide emissions in Mecklenburg County, North Carolina
[PB81-248841] N82-15639
Quantifying environmental impacts
[PB81-244915] N82-15643
Assessment report on the effects of waste dumping in 106-mile ocean waste disposal site: Dumpsite evaluation report
[PB81-241572] N82-15650
Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise
[PB81-246068] N82-15704
Environmental effects of shuttle launch and landing N82-15729
The optical recognition of sea targets as a function of surrounding and observation parameters in air to water observations
[BMVG-FBWT-81-10] N82-15930
ENVIRONMENT MODELS
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
ENVIRONMENT POLLUTION
Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980
[PB81-244806] N82-15616
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637
Environmental effects of shuttle launch and landing N82-15729
ENVIRONMENT PROTECTION
Air pollution emissions inventory systems. Appendix C: Emissions inventory in the Federal Republic of Germany
[PB81-242232] N82-15631
Research outlook, 1981 — toxic hazard research and control
[PB81-243495] N82-15640
Development of an Na distillation process for re-refining waste oil in order to avoid environment pollution. Phase 1: Preliminary tests in Bern
[BMFT-FB-T-81-034] N82-16016
ENVIRONMENT SIMULATION
Continuing development of the DEROB system — calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243
ENVIRONMENTAL ENGINEERING
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636
ENVIRONMENTAL MONITORING
Meteorological satellites
[AD-A107427] N82-15110
The tapered element oscillating microbalance: A monitor for short-term measurement of fine aerosol mass concentration
[PB81-245219] N82-15434
Photoacoustic detection of particulate carbon
[PB81-245425] N82-15435
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] N82-15488
ENVIRONMENTAL QUALITY
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637
Environmental satellite imagery, March 1981
[PB81-248049] N82-15698
EPIDEMIOLOGY
Conference on plant virology N82-15767
EPITAXY
Impurity and defect interactions in GaAs
[AD-A106106] N82-15963
EPOXY RESINS
Stamping tools made of resin N82-15132
EQUATIONS OF MOTION
Flag-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013
EQUATIONS OF STATE
Heating remote rooms in passive solar buildings
[DE81-030247] N82-15246
Theory and implementation of the EOS fitting code RATFIT
[DE81-029110] N82-15831
EQUIPMENT SPECIFICATIONS
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949

EROSIVE BURNING
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609

ERROR ANALYSIS
An M843 block code having an error multiplication smaller than that of the MMS43 code and a reduced portion of the power density spectrum near the frequency zero
[FTZ-FI-044-TBR-86] N82-15266
Simulator data on human error probabilities
[DE81-029094] N82-15786
Preliminary internal data screening: A component of quantitative data analysis in data validation
[CONF-810842-1] N82-16005

ERROR DETECTION CODES
Fault detection and surveillance for a link in a data transmission network
[ENST-D-80010] N82-15269

ESCHERICHIA
Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735

ESTIMATING
On martingales and recursive optimal state estimation
[NLR-TR-80058-U] N82-15838
Tabular aids for fitting Weibull moment estimates
[AD-A105965] N82-15842

ETCHING
AlGaAs/GaAs transverse junction stripe lasers with distributed feedback N82-15913

ETHYL ALCOHOL
The utilisation of alcohol in light duty diesel engines
[PB81-244469] N82-15452

EULER EQUATIONS OF MOTION
Comparison of two and three dimensional flow computations with laser anemometer measurements in a transonic compressor rotor
[NASA-TM-82777] N82-15020

EULER-LAGRANGE EQUATION
Hull/EPIC3 linked Eulerian/Lagrangian calculation in three dimension
[AD-A106033] N82-15368

EUROPE
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15656

EUROPEAN AIRBUS
The Airbus program: quality policy
[SNIAS-812-551-101] N82-15009

EUROPEAN SPACE PROGRAMS
The Faint Object Camera (FOC): European instrument associated with the space telescope
N82-15431

EUROPIUM ISOTOPES
Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970

EUTECTIC ALLOYS
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072

EVALUATION'
Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15658
Analysis of methodologies used for the assessment of wetland values
[PB81-245864] N82-15703

EVAPORATION
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233535] N82-15519

EVAPORATORS
High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] N82-15536

EVOLUTION
Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

EXCIMER LASERS
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15448

EXCITATION
Heavy-ion fusion revisited N82-15864

EXHAUST EMISSION
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621
The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627

EXHAUST GASES
Cryopumping of hydrogen and helium
[DE81-030553] N82-15246
Investigations in a laboratory plant for reheating scrubbed flue gases by means of heat exchangers
[BMFT-FB-T-81-005] N82-15615
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621
Evaluation of solvent loss from vapor degreaser systems. Phase 2 and 3: Effect of crosscurrent air velocity un control system performance
[PB81-246908] N82-15625
Compilation of air pollutant emission factors: Highway mobile sources
[PB81-236305] N82-15638
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] N82-15651
Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654
Environmental effects of shuttle launch and landing N82-15729

EXHAUST SYSTEMS
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626
Evaluation of air cleaning and monitoring equipment used in recirculation systems
[PB81-242695] N82-15788

EXOBIOLOGY
USSR Space Life Sciences Digest
[NASA-TM-84080] N82-15706
Feasibility study (phase A) for a Life Science Double Rack envisaged for the Spacelab mission D1
[BMFT-FB-W-81-037] N82-15732
Concept study of a life sciences payload element (PLE) for the SL-D1 mission
[BMFT-FB-W-81-038] N82-15733
Aerospace Medicine and Biology. A continuing bibliography with indexes (supplement 225)
[NASA-SP-7011(225)] N82-15766

EXPERIMENTAL DESIGN
Control of vibration in aeroelastic cascade experiments N82-15056
Feasibility study: Atmospheric general circulation experiment, volume 1
[NASA-CR-161889-VOL-1] N82-15084
Feasibility study: Atmospheric general circulation experiment, volume 2
[NASA-CR-161889-VOL-2] N82-15085
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15088

EXPLOSIONS
Structural safety analysis of proposed Harpoon test facility
[PML-1979-74] N82-15105

EXPLOSIVE DECOMPRESSION
Dangers of explosive decompression N82-15750

EXPLOSIVES
High-explosive detonations in varying-oxygen atmospheres
[DE81-028179] N82-15228
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
Reaction rates from pressure-gauge measurements in reacting explosives
[DE81-030252] N82-1523
Free-surface velocity measurements of plates driven by reacting and detonating RX-03-BB and PBX-0404
[DE81-026776] N82-15468

EXPOSURE
Health stabilization program N82-15715
Problems in evaluating health effects of occupational and environmental exposures
[DE81-028440] N82-15774
Results of calculations of external gamma-radiation exposure rates from fallout and the related radionuclide compositions. Operation Ranger, 1951
[DE81-030467] N82-15872

EXTINCTION
A simple inversion method for determining aerosol size distributions — using light measurements
[FOA-C-30231-E] N82-15836

EXTREMUM VALUES
Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

EXTRUDING
Comparison of hydrostatic extrusion versus wire drawing as a method of producing Nbsub3Sn superconducting wire
[DE81-030275] N82-15251

F

FABRICATION
Stamping tools made of resin N82-15132
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320
Gallium phosphide high temperature diodes
N82-15322
A gallium phosphide high-temperature bipolar junction transistor N82-15323
Whatever happened to silicon carbide — semiconductor devices N82-15326

FACE (ANATOMY)
Evaluation of chemical protective facelets and comparison of four prototpyes
[IZF-1980-15] N82-15784

FAILURE MODES
An observer approach to the identification and isolation of sensor failures in flight control systems
[DFVLR-FB-81-26] N82-15076
Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221
Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339
Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] N82-15454

FALLOUT
Results of calculations of external gamma-radiation exposure rates from fallout and the related radionuclide compositions. Operation Ranger, 1951
[DE81-030467] N82-15872

FAR INFRARED RADIATION
Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15298
Construction and use of a standard source for far infrared astronomy experiments
[MPI-PAE/EXTRATERR-165] N82-16024

FARADAY EFFECT
Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14839-1] N82-15381

FARM CROPS
Conference on plant virology N82-15767

FATIGUE (MATERIALS)
Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-028603] N82-15171

FATIGUE TESTS
High-temperature fatigue life of type 316 stainless steel containing irradiation induced helium
[DE81-026879] N82-15170

Performance and cost analysis of large capacitor banks using Weibull statistics and MTBF
[DE81-024364] N82-15342

FAULT TOLERANCE
Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295

FAULT TREES
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] N82-15454

FEASIBILITY
Feasibility of electric vehicles in New Zealand
[DE81-803884] N82-16011

FEASIBILITY ANALYSIS
Feasibility analysis of geothermal district heating for Lakeview, Oregon
[DOE/ET-27229/T1] N82-15547
Moorhead district heating, phase 2
[DE81-029869] N82-15556
Micro-hydropower in the United States
[DE81-029271] N82-15567

FEEDBACK CIRCUITS
AlGaAs/GaAs transverse junction stripe lasers with distributed feedback N82-15913

FERRITIC STAINLESS STEELS
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192

FERROELECTRICITY
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-025588] N82-15209
Neutron scattering studies of quasi one- and two-dimensional hydrogen-bonded ferroelectrics
[DE81-030334] N82-15978

FERROGRAPHY
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-15199

FERROMAGNETIC MATERIALS
EDDY: A program for calculating the behavior of electromagnets
[KFK-CAD-166] N82-15302

FERTILIZERS
Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product — ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142

FIBER OPTICS
Investigation of semiconductor clad optical waveguides
[NASA-CR-165074] N82-15278
Role of optical computers in aeronautical control applications N82-15897
Infrared fiber optic focal plane dispersers N82-15918
Fine-grained hodoscopes based on scintillating optical fibers
[DE81-029316] N82-15935

FIBER REINFORCED COMPOSITES
Advanced compressor components. Phase 1: 1978 to 1979 — for aircraft engines
[BMFT-FB-W-81-025] N82-15073
Feasibility study of deformation modes of deforming composite materials using visioplasticity method
[NASA-CR-165067] N82-15125
Study and development of high strength composite material structures by the Thermomechanical Department of the Space Division of Matra N82-15127
Filament winding — general principles N82-15131
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198

FIBER RELEASE
Monitoring techniques for carbon fiber emissions: Evaluation B
[PB81-247413] N82-15619

FIBER STRENGTH
Indentation law for composite laminates
[NASA-CR-165460] N82-15123

FIELD EFFECT TRANSISTORS
Reliability study of refractory gate gallium arsenide MESFETS N82-15324
Solid state microelectronics tolerant to radiation and high temperature — JFET thick film hybrids N82-15331
Characterization of GaAs superhigh frequency field effect power transistors in the nonlinear mode
[ENST-E-81001] N82-15352
Microcomputer and LSI compatible power switch
[BMFT-FB-T-81-093] N82-15793

FIELD THEORY (PHYSICS)
Numerical studies of gauge field theories
[DE81-030526] N82-15846
Polynomial chromodynamics
[DE81-028036] N82-15880

FILAMENT WINDING
Filament winding — general principles N82-15131

FILE MAINTENANCE (COMPUTERS)
Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards
[NASA-CP-2196] N82-15095
OSTA data systems planning workshop recommendations N82-15096
Role of engineering judgement and the computer in the management of material property data
[DE81-029630] N82-15982
Data editing on large data sets
[DE81-028022] N82-16002
Self-describing data file structure for large data sets
[DE81-027997] N82-16004
Managing large-scale models: DBS
[DE81-028663] N82-16006

FILLETS
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-160(1981)] N82-15469

FILM THICKNESS
Some considerations regarding film thickness standards for the semiconductor industry
[PB81-239535] N82-15357

FILMS
Four- and five-layer silicon-clad dielectric waveguides N82-15911

FILTRATION
Laboratory demonstration of the feasibility of using commercially-available, in-depth filters for suspended solids removal by cross-flow filtration
[PB81-243719] N82-15649

FINES
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610

FINITE DIFFERENCE THEORY
Numerical simulation of the countercurrent flow in a gas centrifuge
[DE81-030283] N82-15374
A heat transfer analysis of scald injury
[PB81-236503] N82-15777
Application of steady state finite element and transient finite difference theory to sound propagation in a variable area duct: A comparison with experiment
[NASA-TM-82678] N82-15847

FINITE ELEMENT METHOD
Elements for the numerical analysis of wave motion in layered media
[PB81-245268] N82-15292
NASTRAN user's guide (Level 17.5)
[NASA-CR-3146] N82-15456
Finite-element program for creep analysis of concrete structures
[DE81-028071] N82-15460
Calculation of the stress-strain evolution of a pressure-loaded trapezoid aluminum beam before and after reaching elastic limit
[EK47-059-80] N82-15488
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028889] N82-15602
Application of steady state finite element and transient finite difference theory to sound propagation in a variable area duct: A comparison with experiment
[NASA-TM-82678] N82-15847

FIRE PREVENTION
The effect of fire retardants on the heat-release rate of building materials
[PB81-236487] N82-15259
Oxygen toxication N82-15751

FIREPROOFING
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137

FIRST AID
Shuttle orbital medical system N82-15718

FISHES
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599

FITNESS
Evaluation of crew health N82-15712

FITTING
Tabular aids for fitting Weibull moment estimates
[AD-A105965] N82-15842

FIXED POINTS (MATHEMATICS)
Statistical description of an attractor
[DE81-027706] N82-15830

FLIGHT CONTROL
Selected advanced aerodynamic and active control concepts development
[NASA-CR-3220] N82-15033
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing
[NASA-CR-163115] N82-15074

FLIGHT CREWS
Aviation medical guarantees N82-15761

FLIGHT HAZARDS
Detection of obstacles by low flying aircraft — using CO2 laser; mathematical model
[FOA-C-30227-E1] N82-15026
Harmfulness of violent impact and airflow shocks N82-15742
Caisson disease N82-15749

FLIGHT INSTRUMENTS
An observer approach to the identification and isolation of sensor failures in flight control systems
[DFVLR-FB-81-26] N82-15078

FLIGHT PATHS
Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 3 August 1979
[DFVLR-MITT-81-17] N82-15028

FLIGHT RECORDERS
Integration of a digital air data computer into the test aircraft HFB-320
[DFVLR-MITT-81-09] N82-15036

FLIGHT SAFETY
Aviation medical guarantees N82-15761
Space navigation medical guarantees and medical supervision N82-15762

FLIGHT SIMULATION
Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing
[NASA-TP-1360] N82-15075
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

FLIGHT STRESS (BIOLOGY)
Fundamentals of aeronautical and aerospace medical science
[AD-A102296] N82-15738
General laws of aviation and space navigation environmental effects on the human body N82-15739

FLIGHT TESTS
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

FLOCCULATING
Improving municipal and industrial waste treatment processes: Nutritional and physical conditions that regulate floc formation in bacteria isolated from activated sludge
[PB81-246282] N82-16016

FLOOD CONTROL
Optimal mix of adjustments to floods
[PB81-240533] N82-15511

FLOOD DAMAGE
Optimal mix of adjustments to floods
[PB81-240833] N82-15511
FLORIDA
Fort Canaveral Entrance Glossary of inlets report no. 9
[PB81-236149] N82-15512
Fort George inlet glossary of inlets, report no. 10
[PB81-236665] N82-15513
The behavior of surface wind and thermodynamic fields in the presence of deep convection
[AD-A105686] N82-15687
FLOW CHARACTERISTICS
Influence of three-dimensional effects on the supersonic flow field at the leading edge of a turbomachine cascade
[EPFL-ITA-9] N82-15012
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359
Streamflow characteristics of the Hudson Bay and upper Missouri River Basins, Montana, through 1979
[PB81-247199] N82-15523
FLOW CHARTS
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041
FLOW DISTORTION
Inlet distortion and blade vibration in compressible flow between parallel walls N82-15066
FLOW DISTRIBUTION
Influence of three-dimensional effects on the supersonic flow field at the leading edge of a turbomachine cascade
[EPFL-ITA-9] N82-15012
Investigations of flowfields found in typical combustor geometries
[NASA-CR-165061] N82-15360
FLOW EQUATIONS
On the regularity of the principle value of the double layer potential — the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828
FLOW GEOMETRY
Investigations of flowfields found in typical combustor geometries
[NASA-CR-165061] N82-15360
FLOW MEASUREMENT
Raman-scattering gas temperature measurements in particle-laden flows
[DE81-029621] N82-15370
FLOW THEORY
Hydrodynamic and chemical modeling of heavy metals in ash pond leachates
[DE81-028510] N82-15601
FLOW VELOCITY
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515
Water Resources Data for Wisconsin, water year 1980
[PB81-235186] N82-15516
Evaluation of solvent loss from vapor degreaser systems. Phase 2 and 3: Effect of crosscurrent air velocity on control system performance
[PB81-246306] N82-15625
FLOWMETERS
Calibration and data correction procedures for flow meters and pressure transducers commonly used by the Coastal Studies Unit
[AD-A105594] N82-15418
FLUENCE
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029900] N82-15192
FLUES
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514
Investigations in a laboratory plant for reheating scrubbed flue gases by means of heat exchangers
[BMFT-FB-T-81-005] N82-15615
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] N82-15651
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15652
FLUID DYNAMICS
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
FLUID FILTERS
Laboratory demonstration of the feasibility of using commercially-available, in-depth filters for suspended solids removal by cross-flow filtration
[PB81-243719] N82-15649
FLUID FLOW
High-explosive detonations in varying-oxygen atmospherus
[DE81-028179] N82-15228
FLUIDIZED BED PROCESSORS
Corrosion of high-temperature materials in AFBC environments. Part 2: 4500-h tests
[DE81-028024] N82-15173
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] N82-15222
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609
Evaluating R and D options under uncertainty. Volume 2. Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012
FLUORESCENCE
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446
FLUTTER ANALYSIS
Stability and flutter analysis of turbine blades at low speed N82-15050
On the numerical analysis of stall flutter in turbine cascades N82-15054
Stability analysis of the twin mode model of coupled flexion/torsion vibrations in turbofans N82-15057
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062
Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing
[NASA-TP-1360] N82-15075
FLUX DENSITY
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176
Nickel-iron battery of high energy density
[BMFT-FB-T-81-100] N82-15531
FLY BY WIRE CONTROL
XV-15 Tilt Rotor fly-by-wire collective control demonstrator development specifications
[NASA-CR-166262] N82-15030
FOCUSING
Development of a process camera lens with variable focal length
[BMFT-FB-T-81-155] N82-15415
Aberrations and focusability in large solid-state-laser systems
[DE81-029914] N82-15442
A liquid crystal adaptive lens N82-15921
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933
FOG
Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397
FOILS (MATERIALS)
Testing results of MF-Nbsub3Sn
[DE81-028632] N82-15135
FOOD PROCESSING
All-Union Conference on New Sources of Food Protein and Their Application N82-15765
FORCE DISTRIBUTION
Force and moment coefficients for high deflection cascades — theory behind a computer program N82-15046
FORCED VIBRATION
Elements for the numerical analysis of wave motion in layered media
[PB81-245268] N82-15292
FOREST MANAGEMENT
Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587
FORESTS
Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15480
FORMIC ACID
Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154
FORMING TECHNIQUES
Stamping tools made of resin N82-15132
Matra automobiles: Theillay center — molding of composites N82-15120
FORTRAN
Community noise assessment manual: Computer programs for the Strategy Guidelines for Developing a Community Noise Control Program
[PB81-243024] N82-15841
Cost/benefit analysis of implementing LWG FORTRAN compiler/library systems
[DE81-028252] N82-16001
FOSSIL FUELS
Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] N82-15606
FOULING
Microbiologic aspects of metal corrosion N82-15764
Ecological and technological problem of biodamages N82-15766
FOURIER TRANSFORMATION
The effect of aspect ratio on the unsteady aerodynamic forces induced by vibration of a cascade blade N82-15083
FRACTURE STRENGTH
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15186
Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207
Dimensions, volume 65, number 3
[PB81-235053] N82-15436
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-160(1981)] N82-15469
FREE CONVECTION
Thermal convection simulation in three dimensions by a modified finite element method
[DE81-028847] N82-15632
FREE ELECTRON LASERS
Status of the free-electron laser experiment at Los Alamos
[DE81-030132] N82-15441
FREQUENCIES
Attenuation of coaxial pairs in the lower frequency range
[FTZ-FI-21-TBR-51] N82-15268
FREQUENCY MODULATION
A 16 QAM modem for a 140 Mbit/sec radio relay system
[FTZ-FI-21-TBR-20] N82-15269
FRESH WATER
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234
FUEL COMBUSTION
Proceedings of the conference on wood combustion environmental assessment
[PB81-248155] N82-15602
FUEL CONSUMPTION
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] N82-15453
Fuels and electric energy consumed
[PB81-240442] N82-15584

FUEL INJECTION
Effect of fuel injector type on performance and emissions of reverse-flow combustor
[NASA-TP-1945] N82-15040
FUEL OILS
Heating oils, 1981
[DE81-030833] N82-15223
Thermochemical production of liquids from biomass
[DE81-030065] N82-15226
FUEL PRODUCTION
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234
Fuels and electric energy consumed
[PB81-240442] N82-15594
Hydrogen production based on magnetic fusion
[DE81-029636] N82-15948
FUELS
Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587
FUNCTIONAL ANALYSIS
One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873
FURANS
Thermolysis of naphthols
[DE81-029664] N82-15152
FURNACES
Preparation of Spacelab experiments on Si, CdTe, and ZnS crystal growth during the E1 and D1 missions and construction and testing of a single ellipsoid mirror heating facility
[BMFT-FB-W-81-023] N82-15092
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604
Assessment methodology for the air quality impact of residential wood burning
[DE81-029373] N82-15606
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613
FUSELAGES
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848
FUSION (MELTING)
Design of neutron streak camera for fusion diagnostics
[DE81-029666] N82-15426
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Heavy-ion fusion revisited N82-15884
FUSION REACTORS
Effects of transmutation products on swelling in 316 stainless steel
[DE81-029805] N82-15190
Progress toward fusion energy
[UCRL-84974] N82-15888
Hydrogen production based on magnetic fusion
[DE81-029636] N82-15948
FUSION WELDING
Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093

G

GALLIUM
Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296
GALLIUM ARSENIDE LASERS
AlGaAs/GaAs transverse junction stripe lasers with distributed feedback N82-15913
Monolithically integrated active optical devices — with application in optical communication
N82-15916
GALLIUM ARSENIDES
Ohmic contacts to GaAs for high-temperature device applications N82-15319
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320
CO2 laser waveguiding in proton implanted GaAs
N82-15912
Impurity and defect interactions in GaAs
[AD-A106106] N82-15963
GALLIUM PHOSPHIDES
Gallium phosphide high temperature diodes
N82-15322
A gallium phosphide high-temperature bipolar junction transistor N82-15323
GAMMA RAY SPECTRA
Advanced Gamma Scan System Software package reference manual
[DE81-028094] N82-15819
Selected topics in thermal and resonance neutron capture
[DE81-029676] N82-15864
GAMMA RAYS
Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15205
Results of calculations of external gamma-radiation exposure rates from fallout and the related radionuclide compositions. Operation Ranger, 1951
[DE81-030467] N82-15872
Gamma ray detector for Solar Maximum Mission (SMM) of NASA
[BMFT-FB-W-81-020] N82-16035
GAS ANALYSIS
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433
GAS COOLING
Gas cooled electrical leads for use on forced cooled superconducting magnets
[DE81-029855] N82-15346
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] N82-15530
GAS DISSOCIATION
Preprototype nitrogen supply subsystem development
[NASA-CR-166192] N82-15780
GAS EXPLOSIONS
Formation and spreading of explosive and toxic gas clouds. A study of the literature
[FOA-C-40141-C1] N82-15379
GAS FLOW
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365
Numerical simulation of the countercurrent flow in a gas centrifuge
[DE81-030283] N82-15374
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15652
Sound damping in a condensation loaded gas flow
[MPIS-24/1980] N82-15852
GAS HEATING
Investigations in a laboratory plant for reheating scrubbed flue gases by means of heat exchangers
[BMFT-FB-T-81-005] N82-15615
GAS LASERS
Advanced solar energy conversion — solar pumped gas lasers
[NASA-CR-165060] N82-15526
GAS RECOVERY
High-pressure solvent extraction of methane from geopressured fluids
[DE81-027713] N82-15227
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637
GAS TEMPERATURE
Raman-scattering gas temperature measurements in particle-laden flows
[DE81-029621] N82-15370
GAS TURBINE ENGINES
Effect of fuel injector type on performance and emissions of reverse-flow combustor
[NASA-TP-1945] N82-15040
GAS TURBINES
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067
COST 50: Materials for gas turbines N82-15071
Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines N82-15193
Investigations of flowfields found in typical combustor geometries
[NASA-CR-165061] N82-15360
GAS-SOLID INTERACTIONS
Inlet distortion and blade vibration in compressible flow between parallel walls N82-15066
GASEOUS DIFFUSION
Tritium autoradiography
[DE81-030521] N82-15870
GASOLINE
Motor gasolines, winter 1980-81
[DE81-030645] N82-15224
Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621
GATES (CIRCUITS)
Reliability study of refractory gate gallium arsenide MESFETS N82-15324
GAUGE INVARIANCE
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877
GAUGE THEORY
Numerical studies of gauge field theories
[DE81-030526] N82-15846
GAUSS EQUATION
A model for calculating the absorbed dose to populations taking local weather statistics into consideration — after nuclear reactor accidents
[FOA-C-40140-A3] N82-15692
GEARS
The Link-Miles driver training simulator for tracked vehicles: Influence of cabin motion on gear-change learning
[IZF-1980-24] N82-15785
GENERAL AVIATION AIRCRAFT
Automated Pilot Advisory System
[NASA-TM-73296] N82-15027
Airborne antenna pattern calculations
[NASA-CR-165059] N82-15277
GEOCHEMISTRY
Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617
GEODESY
Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry
[SER-C-261] N82-15812
GEODETIC SATELLITES
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156862] N82-15496
GEODETIC SURVEYS
A history of flying and photography: In the Photogrammetry Division of the National Ocean Survey 1919 - 1979
[PB81-246738] N82-15520
GEOLOGICAL FAULTS
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15656
GEOLOGICAL SURVEYS
Geologic applications of thermal-inertia mapping from satellite — Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489
Geologic hazards and their relation to planning, location, and design of transportation facilities
[PB81-235467] N82-16020
GEOMAGNETIC HOLLOW
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures
[DE81-030700] N82-15562

GEOMAGNETISM
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506
GEOMETRICAL OPTICS
Automatic calculation of spheroelliptical systems, essential facts, and elementary traces (cassette): Utilization
[LAS-OPT.INST-02-81] N82-15822
X-ray microscopy using grazing incidence reflection optics
[DE81-026160] N82-15933
GEOMETRY
Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15378
GEOMORPHOLOGY
Port Canaveral Entrance Glossary of inlets report no. 9
[PB81-236149] N82-15512
Fort George inlet glossary of inlets, report no. 10
[PB81-236626] N82-15513
GEOPHYSICAL FLUID FLOW CELLS
Feasibility study: Atmospheric general circulation experiment, volume 1
[NASA-CR-161889-VOL-1] N82-15084
Feasibility study: Atmospheric general circulation experiment, volume 2
[NASA-CR-161889-VOL-2] N82-15085
GEOPHYSICS
Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] N82-15499
Analytical and numerical model experiments concerning the physics of rock salt formation
[GAMMA-36] N82-15979
GEOPRESSURE
Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701
GEOTECHNICAL ENGINEERING
Reservoir stability studies
[DE81-030099] N82-15510
Geologic hazards and their relation to planning, location, and design of transportation facilities
[PB81-235467] N82-16020
GEOTHERMAL ENERGY CONVERSION
Sandia program in geothermal technology development
[DE81-025394] N82-15546
GEOTHERMAL ENERGY EXTRACTION
Sampling and analysis of potential geothermal sites
[PB81-240061] N82-15593
Temperature histories in geothermal wells: Survey of rock thermomechanical properties and drilling, production, and injection case studies
[DE81-029957] N82-15662
GEOTHERMAL ENERGY UTILIZATION
Feasibility analysis of geothermal district heating for Lakeview, Oregon
[DOE/ET-27229/T1] N82-15547
GEOTHERMAL RESOURCES
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505
Sampling and analysis of potential geothermal sites
[PB81-240061] N82-15593
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15868
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] N82-15881
GRAD: A tool for program analysis and progress monitoring
[DE81-026066] N82-15981
GEOTHERMAL TECHNOLOGY
Sandia program in geothermal technology development
[DE81-025394] N82-15546
GERMANIUM DIODES
Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296
GERMANY
Analysis of two air traffic samples in the terminal area of Frankfurt am Main, 4 August 1978
[DFVLR-MITT-81-12] N82-15029
Air Pollution Pilot Study: Assessment methodology and modeling, 1975 - 1979 (first follow-up report)
[PB81-242257] N82-15629
Air pollution emissions inventory systems. Appendix C: Emissions inventory in the Federal Republic of Germany
[PB81-242232] N82-15631
GETTERS
Recent results on the gettering of tritium from molten lithium
[DE81-029214] N82-15177
GLASS
Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207
GLASS FIBER REINFORCED PLASTICS
Matra automobiles: Theillay center — molding of composites N82-15133
Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455
GLASS FIBERS
Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15205
GLOBAL AIR SAMPLING PROGRAM
Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677
GNOTOBIOTICS
Medical microbiology of crewmembers
N82-15723
GONIOMETERS
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-026470] N82-15419
GRAIN BOUNDARIES
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965
GRAINS (FOOD)
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480
GRAPHITE-EPOXY COMPOSITES
Development of an engineering analysis of progressive damage in composites during low velocity impact
[NASA-CR-165778] N82-15122
Study of traction rupture strength of graphite-epoxy composite material laminates T300/5208, with and without a central hole
[REPT-137] N82-15138
GRAPHITE-POLYIMIDE COMPOSITES
Thermomechanical response of Gr/Pi composites
[NASA-CR-165753] N82-15124
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198
GRAPHS (CHARTS)
Solar radiation measurement project
[NASA-CR-166064] N82-16033
GRASSHOPPERS
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481
GRASSLANDS
The CHON photochemistry of the troposphere: GRASSLANDS project (summer colloquium 1980)
[PB81-233140] N82-15672
GRATINGS (SPECTRA)
Applications of electro-optic gratings in integrated optical signal processing devices N82-15910
Manipulation of light with magneto-optic stripe domain fields N82-15922
GRAVITATION
Heat transport and conduction layers in gravity-assisted heat pipes
[IKE-5-212] N82-15376
GRAVITATIONAL EFFECTS
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15098
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506
Medical problems of gravitational changes and powered flight N82-15740
Injury and protection of overweightness
N82-15741
GRAZING INCIDENCE
The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15865
X-ray microscopy using grazing incidence reflection optics
[DE81-026160] N82-15933
GREAT PLAINS CORRIDOR (NORTH AMERICA)
US/Canada wheat and barley crop calendar exploratory experiment implementation plan
[E82-10016] N82-15494
GREEN FUNCTION
Non-linear vacuum polarization in strong fields
[DE81-026039] N82-15892
GREENHOUSES
Heating and cooling applications of atriums and attached greenhouses: A state-of-the-art report
[DE81-022181] N82-15573
GRINDING (MATERIAL REMOVAL)
Humanization of working places in the foundry by use of an automatic fettling equipment
[BMFT-FB-HA-81-004] N82-15781
GROUND EFFECT (AERODYNAMICS)
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165057] N82-15032
GROUND SUPPORT SYSTEMS
Emergency Medical Services System (EMSS)
N82-15716
GROUND TRUTH
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
GROUND WATER
Research programme 1981/82 — water science
N82-15474
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515
Water Resources Data for Wisconsin, water year 1980
[PB81-235186] N82-15516
Water resources data for Idaho, water year 1980. Volume 1: Great Basin and Snake River Basin above King Hill
[PB81-244188] N82-15517
Water resources data for Idaho, water year 1980. Volume 2: Upper Columbia River Basin and Snake River Basin below King Hill
[PB81-244196] N82-15518
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-236479] N82-15624
GROUND WIND
Experimental and theoretical study of a tall building subjected to wind loading
[DE81-029478] N82-15465
Climatology of high damaging wind in Illinois
[PB81-234767] N82-15693
GROUP DYNAMICS
The composing process in technical communications N82-15893
GUAM
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519

GUANINES
Journal of research of the National Bureau of Standards. Volume 86, no. 4, July - August 1981
[PB81-247017] N82-15164

GUARDS (SHIELDS)
Highway safety appurtenances
[PB81-236065] N82-16021

GUIDE VANES
Study of acoustic resonance of cascades — sound generated by guide vanes; wind tunnel investigations
N82-15068

GULF OF MEXICO
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] N82-15225

GUN PROPELLANTS
Tracer investigations of the laws governing the migration of phlegmatizers in gun propellants
[BMVG-FBWT-81-7] N82-15215

GUST LOADS
Estimation methods for the determination of dynamic responses of elastic aircraft — to random loads
[BMVG-FBWT-81-6] N82-15037
Three-dimensional periodic disturbances acting upon airfoils in cascade N82-15064
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

H

HABITATS
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] N82-15496

HADRONS
Exclusive processes in quantum chromodynamics
[DE81-028233] N82-15151
Dynamics of hadron-nucleus interactions
[DE81-028272] N82-15856

HANDBOOKS
Propagation effects handbook for satellite systems design: A summary of propagation impairments on 10 to 100 GHz satellite links with techniques for system design
[NASA-RP-1082] N82-15270
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636

HANKEL FUNCTIONS
Three methods for performing Hankel transforms
N82-15906

HARBORS
Port Canaveral Entrance Glossary of inlets report no. 9
[PB81-238149] N82-15512
Fort George inlet glossary of inlets, report no. 10
[PB81-238925] N82-15513

HARDENING (MATERIALS)
Present possibilities for the use of microwaves in civil engineering: Bibliographical study
[LBC-96] N82-15235

HARDNESS TESTS
A bibliography of micro-hardness testing
[NPL-MOM-55] N82-15236

HARMONIC EXCITATION
LH wave absorption by mode conversion near ion cyclotron harmonics
[DE81-029434] N82-15947

HARMONIC OSCILLATION
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060

HARMONIC OSCILLATORS
Improvement of tetrode power amplifier efficiency by adding harmonics to the carrier oscillation and energy savings resulting from volume-dependent Pulse-Duration Modulation (PDM) control
[BMFT-FT-T-81-163] N82-15309
The tapered element oscillating microbalance: A monitor for short-term measurement of fine aerosol mass concentration
[PB81-245219] N82-15434

HAZARDS
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775

HAZE
UMR dual mode CCN counter (modes: CFD plus haze) N82-15387
An airborne isothermal haze chamber N82-15390
Description of the NRL isothermal haze chamber
N82-15396
Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397
Review of isothermal haze chamber performance
N82-15403

HEALTH
STS-1 medical report
[NASA-TM-58240] N82-15711
Evaluation of crew health N82-15712
Health stabilization program N82-15715

HEALTH PHYSICS
Workshop on indoor air quality research needs
[DE81-026488] N82-15612
Radiological health N82-15727
Problems in evaluating health effects of occupational and environmental exposures
[DE81-026440] N82-15774
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775

HEARING
Noise and sense of hearing N82-15747

HEART RATE
Crew cardiovascular profile N82-15720

HEAT ACCLIMATIZATION
The physiological effect of heat and its prevention
N82-15754

HEAT BALANCE
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028896] N82-15242
Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699

HEAT BUDGET
Heat-load measurement of prototype cryogenic magnets and leads for the ISABELLE project
[DE81-030550] N82-15951

HEAT EXCHANGERS
Corrosion of high-temperature materials in AFBC environments. Part 2: 4500-h tests
[DE81-026024] N82-15173
US ceramic heat exchanger technology: Status and opportunities
[DE81-029686] N82-15210
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] N82-15367
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] N82-15560
Investigations in a laboratory plant for reheating scrubbed flue gases by means of heat exchangers
[BMFT-FB-T-81-005] N82-15615

HEAT FLUX
Heat transport and conduction layers in gravity-assisted heat pipes
[IKE-5-212] N82-15376
Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699

HEAT MEASUREMENT
Heat-load measurement of prototype cryogenic magnets and leads for the ISABELLE project
[DE81-030550] N82-15951

HEAT OF COMBUSTION
Heating oils, 1981
[DE81-030633] N82-15223

HEAT PIPES
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] N82-15134
Heat transport and conduction layers in gravity-assisted heat pipes
[IKE-5-212] N82-15376
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532

HEAT PUMPS
Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] N82-15563
Using microcomputers to monitor the field performance of residential heat pumps
[PB81-240608] N82-15808

HEAT RADIATORS
Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366

HEAT RESISTANT ALLOYS
COST 50: Materials for gas turbines N82-15071
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072
Application of skin technology: TEXUS 2 experiment
[BMFT-FB-W-81-026] N82-15087
Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines N82-15193

HEAT SHIELDING
Transient response of a thermal buffer: A study for ISABELLE
[DE81-030549] N82-15950

HEAT SOURCES
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] N82-15558

HEAT STORAGE
Investigation of medium and high temperature phase change materials for thermal energy storage
[BMFT-FB-T-81-149] N82-15536
The Mit Abu El Kom Solar demonstration project in Egypt. Phase A: Solar thermal installations
[BMFT-FB-T-81-164] N82-15540
Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] N82-15558
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] N82-15571
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] N82-15579
Development of a modular heat exchanger with integrated latent heat energy store — for solar heating applications
[BMFT-FB-T-81-050] N82-15584

HEAT STROKE
The physiological effect of heat and its prevention
N82-15754

HEAT TOLERANCE
The physiological effect of heat and its prevention
N82-15754

HEAT TRANSFER
Steady-state heat transfer to boiling liquid helium in simulated coil windings
[DE81-028561] N82-15371
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] N82-15558
A heat transfer analysis of scald injury
[PB81-238503] N82-15777

HEAT TRANSFER COEFFICIENTS
Gas cooled electrical leads for use on forced cooled superconducting magnets
[DE81-029855] N82-15346
A heat transfer analysis of scald injury
[PB81-238503] N82-15777

HEATERS
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527

HEATING
Lower hybrid rf heating experiments in the MIT Alcator A, C and Versator II Tokamaks
[DE81-028193] N82-15941

HEATING EQUIPMENT

Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221

Moorhead district heating, phase 2
[DE81-[illegible]] N82-15556

Using microcomputers to monitor the field performance of residential heat pumps
[PB81-240606] N82-15806

HEAVY IONS

Continuum electron emission in heavy ion: Atom collisions
[DE81-028234] N82-15860

Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879

Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880

Dissipative reaction dynamics of heavy-ion collisions N82-15881

A two dimensional position sensitive deltaE-E counter for energetic light charged particles
N82-15882

Reaction parameters for heavy-ion collisions
N82-15883

Heavy-ion fusion revisited N82-15884

The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885

the 165Ho + 56Fe reaction at E sub lab = 462 MeV N82-15886

HEAVY LIFT LAUNCH VEHICLES

Satellite Power System: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238] N82-15524

HEIGHT

Reports from the German Meteorological Service. Number 154: Statistics of the maximum mixing height according to radiosonde measurements for the aerological stations of the German Meteorological Service for the period 1957-1973 — relation to air pollution
[ISSN-0072-4130] N82-15595

HELICOPTER DESIGN

Helicopter landing gear design and test criteria investigation
[AD-A105512] N82-15035

HELICOPTERS

Flag-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013

Helicopter landing gear design and test criteria investigation
[AD-A105512] N82-15035

Community rotorcraft air transportation benefits and opportunities
[NASA-CR-166266] N82-16006

HELIOS SATELLITES

Data evaluation and data processing of the low-energy particle spectrometer E6 on board the HELIOS probes
[BMFT-FB-W-81-035] N82-15416

The instruments of the plasma experiment onboard the HELIOS solar probe
[BMFT-FB-W-81-015] N82-16034

The interactions of the HELIOS probe with the solar wind plasma
[BMFT-FB-W-81-036] N82-16036

HELIOS 1

A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039

HELIOS 2

A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039

HELIOSTATS

Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] N82-15530

HELIUM

High-temperature fatigue life of type 316 stainless steel containing irradiation induced helium
[DE81-029879] N82-15170

Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-029803] N82-15171

Gas cooled electrical leads for use on forced cooled superconducting magnets
[DE81-029855] N82-15346

HEMATOLOGY

Hematological and immunological analyses
N82-15722

HEMODYNAMIC RESPONSES

Crew cardiovascular profile N82-15720

Non-invasive pulmonary arterial pressure measurement
[PB81-239410] N82-15776

HETEROGENEITY

Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229

HETEROJUNCTIONS

Process development for large-scale production of CdS thin film solar cells Sputtered copper sulfide layers and cadmium sulfide-copper sulfide heteorojunctions. Application of high rate sputtering using hot-pressed targets
[BMFT-FB-T-81-069] N82-15528

HEURISTIC METHODS

Analysis of heuristics for stochastic programming: Results for hierarchical scheduling problems
[MC-BUT-142/81] N82-15816

HFB-320 AIRCRAFT

Integration of a digital air data computer into the test aircraft HFB-320
[DFVLR-MITT-81-09] N82-15038

HIERARCHIES

Depth/breadth tradoff in hierarchical computer menus
[DE81-028392] N82-15799

HIGH ENERGY FUELS

Exploratory study of coal-conversion chemistry
[DE81-016136] N82-15552

HIGH ENERGY INTERACTIONS

Quarkonium spectroscopy
[DE81-028229] N82-15159

Hypernuclei and interactions of kaons with nuclei
[DE81-028467] N82-15858

Heavy-ion fusion revisited N82-15884

HIGH GRAVITY ENVIRONMENTS

Injury and protection of overweightness
N82-15741

HIGH PRESSURE

Liquid natural gas rapid phase transitions
[PB81-244774] N82-15232

Packaging techniques for low-altitude Venus balloons beacon N82-15336

Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975

HIGH STRENGTH ALLOYS

Evaluation of the crack initiation life behavior of fatigue loaded automotive components made from high strength aluminum alloys
[DFVLR-FB-81-10] N82-15459

HIGH STRENGTH STEELS

Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461

HIGH TEMPERATURE

Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557

Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604

HIGH TEMPERATURE ENVIRONMENTS

Proceedings of the Conference on High-temperature Electronics
[NASA-TM-84069] N82-15311

High temperature electronics applications in space exploration N82-15312

High temperature electronic requirements in aeropropulsion systems
[E-708] N82-15313

Passive components for high temperature operation N82-15314

Development of an 1100 deg F capacitor
N82-15315

High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15316

Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317

Amorphous metallizations for high-temperature semiconductor device applications N82-15318

Ohmic contacts to GaAs for high-temperature device applications N82-15319

Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320

Development of integrated thermionic circuits for high-temperature applications N82-15321

Gallium phosphide high temperature diodes
N82-15322

A gallium phosphide high-temperature bipolar junction transistor N82-15323

Reliability study of refractory gate gallium arsenide MESFETS N82-15324

Electrical switching in cadmium boracite single crystals N82-15325

Whatever happened to silicon carbide — semiconductor devices N82-15326

Minus 55 to plus 200 deg C 12 bit analog-to-digital converter N82-15327

Process characteristics and design methods for a 300 deg quad OP amp N82-15328

Hybrid A/D converter for 200 deg C operation
N82-15329

Wireless, in-vessel neutron monitor for initial core-loading of advanced breeder reactors
N82-15330

Solid state microelectronics tolerant to radiation and high temperature — JFET thick film hybrids
N82-15331

High temperature LSI N82-15332

High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333

A presently available energy supply for high temperature environment (550-1000 deg F)
N82-15334

Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335

Packaging techniques for low-altitude Venus balloons beacon N82-15336

High temperature (Al2O3) insulation and light weight conductors N82-15337

Hot dry rock geothermal prospects, 1981
[DE81-025305] N82-15559

HIGH TEMPERATURE TESTS

Continuously variable electrooptic filter
[DE81-025393] N82-15934

HIGH VOLTAGES

Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298

HIGHWAYS

Highway safety appurtenances
[PB81-236085] N82-16021

HILBERT SPACE

One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873

HISTOGRAMS

NOSS-SCAT wind direction alias removal
[NASA-CR-165069] N82-15680

HISTORIES

The developmental history of aeronautical and aerospace medical science N82-15737

HODOSCOPES

Fine-grained hodoscopes based on scintillating optical fibers
[DE81-029316] N82-15935

HOLOGRAMMETRY

Multifacet holographic optical elements
N82-15920

HOLOGRAPHY

Multifacet holographic optical elements
N82-15920

HOMING

Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111

HORIZONTAL ORIENTATION

Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705

HORIZONTAL SPACECRAFT LANDING
Environmental effects of shuttle launch and landing N82-15729
HOT PRESSING
Hot isostatic pressing of aluminum alloy castings
[AD-A105562] N82-15169
HOT WORKING
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-166] N82-15252
HOUSINGS
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
HOVERING STABILITY
Flap-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013
HTPB PROPELLANTS
Accelerated aging of HTPB-based composite propellants and liners
[FOA-C-20405-D1] N82-15216
HUDSON RIVER (NY-NJ)
Streamflow characteristics of the Hudson Bay and upper Missouri River Basins, Montana, through 1979
[PB81-247199] N82-15523
HUGONIOT EQUATION OF STATE
Low pressure Hugoniot cusp in polymeric materials
[DE81-026267] N82-15204
Shock-compression measurements at pressures greater than 1 TPa
[DE81-030113] N82-15372

[PB81-234767] N82-15693

ILLUMINANCE
Continuing development of the DEROB system — calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243

ILLUMINATING
Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247

ILLUSIONS
Flight illusions N82-15745

IMAGE CONVERTERS
Electron optical mask projector with a photocathode for miniaturization
[BMFT-FB-T-81-089] N82-15412

IMAGE CORRELATORS
Optical recognition of statistical patterns N82-15907

IMAGE PROCESSING
Electronic picture base
[BMFT-FB-DV-81-005] N82-15796
Development of a computerized measuring system for quantitative digital image analysis interactive Image Analysis System (IBAS)
[BMFT-FB-T-81-035] N82-15820
Air Force research in optical processing N82-15895
Energy normalization of TV viewed optical correlation (automated correlation plane analyzer for an optical processor) N82-15903
Optical recognition of statistical patterns N82-15907
Microchannel spatial light modulator N82-15917
Infrared fiber optic focal plane dispersers N82-15918
Multifacet holographic optical elements N82-15920

IMAGE RECONSTRUCTION
Viking lander imaging investigation during extended and continuation automatic missions. Volume 2: Lander 2 picture catalog of experiment data record
[NASA-RP-1068-VOL-2] N82-16026

IMAGE RESOLUTION
Study of the influence of precipitations and clouds on the performance of synthetic aperture radars
[ESA-CR(P)-1465] N82-15290
Field tests of a Thorn EMI acoustic camera used in an underwater acoustic television system
[FOA-C-30225-E1] N82-15432
Theoretical study of image spots with the wide field camera and the implications for nebular spectrography — computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15939

IMAGE TUBES
Ruggedized electronographic tube development
[NASA-CR-166762] N82-15297

IMAGERY
Environmental satellite imagery, March 1981
[PB81-248049] N82-15696

IMAGING TECHNIQUES
Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195
Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB81-244071] N82-15354
Electron radiation systems for structure production. Part 1: Physical foundations and experimental results
[BMFT-FB-T-81-090-VOL-1] N82-15413
A liquid crystal adaptive lens N82-15921

IMMUNOLOGY
Hematological and immunological analyses N82-15722

IMPACT DAMAGE
Development of an engineering analysis of progressive damage in composites during low velocity impact
[NASA-CR-165778] N82-15122

IMPACT LOADS
Low pressure Hugoniot cusp in polymeric materials
[DE81-028267] N82-15204

IMPACT TESTS
Indentation law for composite laminates
[NASA-CR-165460] N82-15123

IMPACTORS
Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-008] N82-15851

IMPEDANCE PROBES
Impedance probe: The electron density experiment onboard the aeronomy satellites AEROS
[BMFT-FB-W-81-006] N82-15670

IMPELLERS
Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15378

IMPROVEMENT
Fuel-performance-improvement program
[DE81-029617] N82-15218

IMPURITIES
Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143
Impurity and defect interactions in GaAs
[AD-A106106] N82-15963

IN-FLIGHT MONITORING
Inflight observations N82-15713

INCIDENCE
New baseline system N82-15501
Squinted SAR system N82-15502

INCINERATORS
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636

INCOHERENT SCATTERING
Air Force research in optical processing N82-15895
Incoherent optical matrix-matrix multiplier N82-15901

INCOMPRESSIBLE FLOW
Calculation of nonstationary force ratios on blades of a rotating row in incompressible flow N82-1[illegible]

INCOMPRESSIBLE FLUIDS
Thermal convection simulation in three dimensions by a modified finite element method
[DE81-029647] N82-1[illegible]

INDENTATION
Indentation law for composite laminates
[NASA-CR-165460] N82-15123

INDEPENDENT VARIABLES
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] N82-15484

INDEXES (DOCUMENTATION)
Index to NASA News Releases and Speeches, 1980 N82-1[illegible]

INDIA
Indian energy abstracts
[PB81-232316] N82-1[illegible]

INDICATING INSTRUMENTS
Development of power system measurements
[PB81-246860] N82-1[illegible]

INDUSTRIAL ENERGY
Industrial process heat applications for solar thermal technologies
[DE81-025934] N82-15546

INDUSTRIAL PLANTS
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-090] N82-15387
Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] N82-15550

INDUSTRIAL SAFETY
Structural safety analysis of proposed Harpoon test facility
[PML-1979-74] N82-15105

INDUSTRIAL WASTES
Recovery of raw materials by pyrolysis
[BMFT-FB-T-81-017] N82-15141
Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980
[PB81-244808] N82-15616
Monitoring techniques for carbon fiber emissions: Evaluation B
[PB81-247413] N82-15619
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-1[illegible]
Development of an Na distillation process for re-refining waste oil in order to avoid environment pollution. Phase 1: Preliminary tests in Bern
[BMFT-FB-T-81-034] N82-16016

INDUSTRIES
Technique for planning and managing industrial growth from the air-quality standpoint
[DE81-028342] N82-15614

INELASTIC COLLISIONS
Dissipative reaction dynamics of heavy-ion collisions N82-15881

INERTIAL CONFINEMENT FUSION
Technology of controlled nuclear fusion
[DE81-027361] N82-15880

INERTIAL FUSION (REACTOR)
Low-energy X-ray emission from light ion targets
[DE81-028249] N82-15885

INERTIAL UPPER STAGE
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165066] N82-15115

INFILTRATION
Mobile infiltration test unit: Its design and capabilities, preliminary experimental results
[DE81-031927] N82-15245

INFLATABLE STRUCTURES
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027613] N82-15551

INFLATING
Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-1[illegible]

INFORMATION DISSEMINATION
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] N82-15506
Environmental programs for Ocean Thermal Energy Conversion (OTEC)
[DE81-028878] N82-15570
Federal records management: A history of neglect
[PB81-237133] N82-15963
Index to NASA News Releases and Speeches, 1980 N82-15985
INFORMATION FLOW
Federal records management: A history of neglect
[PB81-237133] N82-15963
INFORMATION MANAGEMENT
Medical information management N82-15730
Analysis of responses to survey of DTIC's military users on current and planned technical library/information center automation
[AD-A105507] N82-15999
INFORMATION RETRIEVAL
Depth/breadth tradoff in hierarchical computer menus
[DE81-028392] N82-15799
A Workshop on Qualitative Information Retrieval
[AD-A105897] N82-16000
Self-describing data file structure for large data sets
[DE81-027997] N82-16004
INFORMATION SYSTEMS
Implementation and application of a set theoretical data base system
[BMFT-FB-DV-81-004] N82-15797
INFRARED DETECTORS
Infrared fiber optic focal plane dispersers N82-15918
INFRARED INTERFEROMETERS
Optical analysis and alignment applications using the infrared Smartt interferometer
[DE81-030257] N82-15937
INFRARED LASERS
Optical analysis and alignment applications using the infrared Smartt interferometer
[DE81-030257] N82-15937
INFRARED RADIATION
Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] N82-15504
Transmission and emission of the atmosphere; continued measurements and analysis of the data
[PHL-1979-50] N82-15655
INFRARED RADIOMETERS
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845
INFRARED SCANNERS
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures
[DE81-030700] N82-15562
INFRARED SPECTRA
Chemical modification of TiO2 surfaces with methylsilanes and characterization by infrared absorption spectroscopy
[NASA-CR-165063] N82-15139
The ROSCOE manual. Volume 26-1: Molecular band model parameters for thermal emissions: Expanded wavelength coverage
[AD-A106077] N82-15659
Evaluation of infrared simulation data
[AD-A105872] N82-15931
National synchrotron light source in the infrared region
[DE81-030037] N82-15932
INJECTION LASERS
Laser diode
[BMFT-FB-T-81-151] N82-15439
INJECTION MOLDING
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] N82-15561
INLET FLOW
Inlet distortion and blade vibration in compressible flow between parallel walls N82-15066
Calculation of unstarted-choked regime of supersonic and transonic compressor cascades N82-15364
INLETS (TOPOGRAPHY)
Port Canaveral Entrance Glossary of inlets report no. 9
[PB81-238149] N82-15512
Fort George inlet glossary of inlets, report no. 10
[PB81-238925] N82-15513
INORGANIC NITRATES
Air quality data for nonmetallic inorganic ions: Nitrate and sulfate for 1977 and 1978 from the National Air Surveillance Networks
[PB81-248148] N82-15647
INSECTS
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029980] N82-15507
INSOLATION
Solar radiation measurement project
[NASA-CR-165064] N82-16033
INSULATION
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
INSULATORS
Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15205
Development of a prototype of a test apparatus for the determination of the thermal conductivity in solids, on powders and foams
[BMFT-FB-T-81-052] N82-15409
Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975
INTEGRATED CIRCUITS
Integrated circuits for TV and radio applications
[BMFT-FB-T-81-088] N82-15279
Integrated filter for video color processing
[BMFT-FB-T-81-085] N82-15300
Electrical screening of integrated circuits by semi-insulating silicon layers
[BMFT-FB-T-81-134] N82-15305
Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317
Development of integrated thermionic circuits for high-temperature applications N82-15321
Computer aids for circuits designs --- computerized design for reproduction of integrated circuits
[BMFT-FB-T-80-185] N82-15348
Advanced planar silicon test structures
[PB81-229155] N82-15353
Technology related investigations of hardware variations depending on system proposals and new approaches to decoders for Videotext-Bildschirmtext
[BMFT-FB-T-81-024] N82-15791
Infrared fiber optic focal plane dispersers N82-15918
INTEGRATED OPTICS
Optical Information Processing for Aerospace Applications
[NASA-CP-2207] N82-15894
Air Force research in optical processing N82-15895
Bulk and integrated acousto-optic spectrometers for radio astronomy N82-15902
The integrated optic RF spectrum analyzer N82-15909
AlGaAs/GaAs transverse junction stripe lasers with distributed feedback N82-15913
Evaporated As2S3 Luneburg lenses for LiNbO3:Ti optical waveguides N82-15914
INTERATOMIC FORCES
Potential determination of the system sodium (3 2P) plus mercury (6 1S) by measuring and analyzing the rainbow scattering in the superthermal energy domain between 0.3 and 3.2eV
[MPIS-23/1980] N82-15867
INTERCALATION
Phonons in graphite intercalation compounds measured by neutron scattering
[DE81-029681] N82-15866
INTERFACES
Integration of a digital air data computer into the test aircraft HFB-320
[DFVLR-MITT-81-09] N82-15038
Panel B report: Standards needed to interconnect ADS pilots for data sharing for user interfaces N82-15102
Panel D report: Standards needed to interconnect ADS pilots for data sharing in data formats and descriptions N82-15104
Topography of the electrical properties of the silicon/oxide interface and the influence of technologic treatments
[BMFT-FB-T-81-088] N82-15301
INTERFACIAL ENERGY
Internal convection under low gravity due to orthogonal gradients of temperature and concentration
[BMFT-FB-W-81-041] N82-15089
INTERFACIAL TENSION
The role of the wettability for the production of composite materials in space: Quantities, influences and models
[BMFT-FB-W-81-021] N82-15094
Safety, reliability, cost reduction: Permanent objectives of the modern aerospace industry and how studies in tribology contribute to the formulation of future solutions
[SNIAS-812-551-111] N82-15451
INTERFEROMETERS
Pressure-shear loading of materials
[DE81-026250] N82-15462
INTERFEROMETRY
Time-resolved wave profile measurements in copper to Megabar pressures
[DE81-026109] N82-15373
Use of Zernike polynomials and interferometry in the optical design and assembly of large carbon-dioxide laser systems
[DE81-030138] N82-15443
Dynamic shear-wave velocity measurements using interferometric techniques
[DE81-026973] N82-15467
Interferometric surface-wave acousto-optic time-integrating correlators N82-15905
INTERGRANULAR CORROSION
Corrosion of high-temperature materials in AFBC environments. Part 2: 4500-h tests
[DE81-028024] N82-15173
INTERMOLECULAR FORCES
Internal convection under low gravity due to orthogonal gradients of temperature and concentration
[BMFT-FB-W-81-041] N82-15089
Depopulation rates for combustion-related species in long-lived vibrationally or electronically excited levels
[DE81-030042] N82-15968
INTERNAL COMBUSTION ENGINES
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] N82-15453
INTERNATIONAL SUN EARTH EXPLORER 1
Energetic particles flux experiment for ISEE mother/daughter spacecraft
[NASA-CR-166761] N82-16026
INTERNATIONAL SUN EARTH EXPLORER 2
Energetic particles flux experiment for ISEE mother/daughter spacecraft
[NASA-CR-166761] N82-16026
INTERNATIONAL SUN EARTH EXPLORERS
Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15658
INTERPLANETARY DUST
Investigations of micrometeorite impacts on large surfaces and during long-term missions
[TUM-RT-TB-80/12] N82-15090
INTERPLANETARY MAGNETIC FIELDS
Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246688] N82-16037
INTERPROCESSOR COMMUNICATION
Specifications of Sandia prototype network communications interface between applications software and NSC A120 adapters
[DE81-026451] N82-15824
INVERTED CONVERTERS (DC TO AC)
High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333
IODINE
Oxidation of metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15586

IODINE LASERS
Advanced solar energy conversion -- solar pumped gas lasers
[NASA-CR-165080] N82-15526
ION BEAMS
Ion beam surface modification
[NASA-CR-165082] N82-15196
Mid-rapidity pion cross sections: New data confront theories
[DE81-028014] N82-15866
ION CYCLOTRON RADIATION
Breakdown in the PRETEXT Tokamak
[DE81-029962] N82-15945
ION DENSITY (CONCENTRATION)
Development of power system measurements
[PB81-246860] N82-15355
ION EMISSION
Space-resolved measurements of neutrons and ions emitted by a plasma focus
[IPF-80-8] N82-15940
Energy analysis of fast ions from plasma focus discharges
[IPF-80-11] N82-15960
ION EXCHANGING
Disequilibrium of hydrogen sulfide in ground water by aeration
[PB81-244717] N82-15628
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Dissipative reaction dynamics of heavy-ion collisions N82-15881
ION IMPLANTATION
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-028388] N82-15209
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320
CO2 laser waveguiding in proton implanted GaAs N82-15912
Impurity and defect interactions in GaAs
[AD-A106106] N82-15963
ION IRRADIATION
Precipitation and cavity formation in austenitic stainless steels during irradiation
[DE81-029062] N82-15174
ION SCATTERING
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15876
ION SOURCES
Improvement of gas efficiency of negative ion sources
[DE81-029031] N82-15862
IONIC COLLISIONS
Theory of Coulomb distortion of pion spectra by heavy-ion spectator fragments
[DE81-028013] N82-15867
One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Dissipative reaction dynamics of heavy-ion collisions N82-15881
Reaction parameters for heavy-ion collisions N82-15883
The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885
IONIZATION CROSS SECTIONS
Mid-rapidity pion cross sections: New data confront theories
[DE81-028014] N82-15866
IONIZING RADIATION
Ionizing radiation and its biological effects N82-15756
IONOSPHERIC ELECTRON DENSITY
Impedance probe: The electron density experiment onboard the aeronomy satellites AEROS
[BMFT-FB-W-81-006] N82-15670
IONOSPHERIC SOUNDING
The AEROS retarding potential analyzer -- for ionospheric plasma parameter determination
[BMFT-FB-W-81-007] N82-15666
Sounding rocket program AERONOMY project: 'Polar High Atmosphere' mass spectrometer experiment -- magnetic storm activity
[BMFT-FB-W-81-027] N82-15671
IONS
The mass spectrometer experiment in the program AEROS
[BMFT-FB-W-81-030] N82-15667
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735
IPAD
Development of Integrated Programs for Aerospace-Vehicle Design (IPAD) - IPAD user requirements
[NASA-CR-2985] N82-15034
IRELAND
Archaeoastronomy in the Americas -- conference
[BP-AP-22] N82-16023
IRON
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
Shock-compression measurements at pressures greater than 1 TPa
[DE81-030113] N82-15372
IRON ALLOYS
Swelling of several commercial alloys following high fluence neutron irradiation
[DE81-029804] N82-15191
IRRADIATION
High-temperature fatigue life of type 316 stainless steel containing irradiation induced helium
[DE81-028679] N82-15170
Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-028603] N82-15171
Preirradiation microstructural development designed to minimize properties degradation during irradiation in austenitic alloys
[DE81-028612] N82-15180
Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15206
Fuel-performance-improvement program
[DE81-029617] N82-15218
The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885
ISCHEMIA
Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773
ISOMERS
Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(nca)2) NCS
[AD-A105595] N82-15964
ISOSTATIC PRESSURE
Thermal-fatigue properties of coated materials for fusion-device applications
[DE81-028367] N82-15463
ITERATIVE NETWORKS
Matrix vector multiplier with time varying single dimensional spatial light modulators N82-15900
ITERATIVE SOLUTION
On the choice of suitable operators and parameters in multigrid methods -- for solving elliptic boundary value problems
[MC-NW-107/81] N82-15829

J

JUNCTION DIODES
Gallium phosphide high temperature diodes N82-15322
JUNCTION TRANSISTORS
A gallium phosphide high-temperature bipolar junction transistor N82-15323
JUPITER PROBES
Influence of precursor heating on viscous flow around a Jovian entry body
[NASA-CR-3174] N82-15361

K

KALMAN-SCHMIDT FILTERING
On martingales and recursive optimal state estimation
[NLR-TR-80058-U] N82-15636
KAONS
Hypernuclei and interactions of kaons with nuclei
[DE81-028467] N82-15888
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877
KEROSENE
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233
KIDNEYS
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772
KINETIC ENERGY
the 165Ho + 56Fe reaction at E sub lab = 462 MeV N82-15886
KINETIC HEATING
Kinetic theory of Alfven wave heating
[DE81-029777] N82-15582
KLEIN-GORDON EQUATION
Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946
KRYPTON FLUORIDE LASERS
Compact 36 kJ electron beam system for laser pumping
[DE81-024375] N82-15440

L

L-1011 AIRCRAFT
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076
LAKE MICHIGAN
Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617
LAKE ONTARIO
Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-236982] N82-15632
LAKES
Studies of the effects of operating the Mt. Elbert Pumped-Storage Powerplant on Twin Lakes, Colorado: 1979 report of findings
[PB81-240483] N82-15621
LAMINAR BOUNDARY LAYER
Calculation of three-dimensional instability modes in a Blasius boundary layer
[IC-AERO-81-01] N82-15377
LAMINAR FLOW
Natural laminar flow airfoil analysis and trade studies
[NASA-CR-159029] N82-15018
LAMINATES
Indentation law for composite laminates
[NASA-CR-165460] N82-15123
Thermomechanical response of Gr/PI composites
[NASA-CR-165753] N82-15124
Study of high quality composite materials at Limours, France N82-15129
LAND USE
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10016] N82-15496
LANDAU-GINZBURG EQUATIONS
Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178
LANDING GEAR
Helicopter landing gear design and test criteria investigation
[AD-A105512] N82-15035
LANDSAT 2
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10006] N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495
LANDSAT 3
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10006] N82-15483

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495

LANTHANUM
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-028386] N82-15209

LAPLACE EQUATION
On the regularity of the principle value of the double layer potential -- the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828

LARGE SCALE INTEGRATION
Semiconductor technology for VLSI: Plasma etching and high pressure oxidation
[BMFT-FB-T-81-115] N82-15304
High temperature LSI N82-15332
Concerning technical means for dealing with aspects of the near-term information onslaught
[DE81-030159] N82-16007

LARGE SPACE TELESCOPE
Development of the ARIES parachute system
[NASA-TM-84082] N82-15023
The Faint Object Camera (FOC): European instrument associated with the space telescope
N82-15431
Microcomputer and LSI compatible power switch
[BMFT-FB-T-81-093] N82-15793

LARVAE
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029680] N82-15507

LASER ANEMOMETERS
Comparison of two and three dimensional flow computations with laser anemometer measurements in a transonic compressor rotor
[NASA-TM-82777] N82-15020

LASER ANNEALING
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826

LASER APPLICATIONS
The signal to noise ratio of a heterodyne laser detection system
[PHL-1980-11] N82-15438
Optical tooling for Antares
[DE81-030258] N82-15444
Laser depth sounding in the Baltic Sea --- from airplanes
[FOA-C-30219-E1] N82-15702
Other biological effects of radiation N82-15757

LASER CAVITIES
Aberrations and focusability in large solid-state-laser systems
[DE81-029914] N82-15442

LASER DOPPLER VELOCIMETERS
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter -- turbomachinery applications
[MITT-79-04] N82-15429

LASER FUSION
Aberrations and focusability in large solid-state-laser systems
[DE81-029914] N82-15442
Phase aberrations and beam cleanup techniques in carbon-dioxide laser fusion systems
[DE81-030139] N82-15445

LASER GYROSCOPES
Research on magneto-optical bias elements for laser gyros
[DFVLR-FB-81-21] N82-15417

LASER INTERFEROMETRY
Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15861

LASER PLASMAS
Parameterization of the bremsstrahlung spectrum
[DE81-029739] N82-15859

LASER PUMPING
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437
Compact 36 kJ electron beam system for laser pumping
[DE81-024375] N82-15440
Advanced solar energy conversion --- solar pumped gas lasers
[NASA-CR-165060] N82-15526

LASER SPECTROSCOPY
Investigation by means of laser magnetic resonance of the OH/HO_2 reaction yielding H_2O/O_2
[MPIS-18A/1980] N82-15161

LASER TARGET DESIGNATORS
Detection of obstacles by low flying aircraft -- using CO_2 laser; mathematical model
[FOA-C-30227-E1] N82-15029

LASERS
Monolithically integrated active optical devices -- with application in optical communication
N82-15916

LATERAL CONTROL
An observer approach to the identification and isolation of sensor failures in flight control systems
[DFVLR-FB-81-26] N82-15078

LATHES
Development of a measuring, control, and regulation unit for a cylinder turning machine
[BMFT-FB-T-81-106] N82-15450

LATIN SQUARE METHOD
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198

LATTICE PARAMETERS
Computer simulation of bulk and surface chemical diffusion of light atoms in metals
[DE81-025159] N82-15175

LAUNCH VEHICLE CONFIGURATIONS
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107

LAUNCHERS
Electromagnetic launcher: A new weapon
[DE81-029979] N82-15287

LEACHING
Hydrodynamic and chemical modeling of heavy metals in ash pond leachates
[DE81-028510] N82-15801

LEAD (METAL)
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-028386] N82-15209

LEADING EDGE FLAPS
Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report)
[NASA-CR-165806] N82-15014

LEAKAGE
High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333
Advanced planar silicon test structures
[PB81-229155] N82-15353

LEARNING
Using sentence combining in technical writing classes N82-15994

LEARNING THEORY
Analogical acts as conceptual strategies in science, engineering and the humanities N82-15997

LEAST SQUARES METHOD
An algorithm which determines the global least squares equidistant spline fit
[NLR-TR-80008-U] N82-15837

LEGAL LIABILITY
Trends in liability affecting technical writers
N82-15998

LENS DESIGN
Development of a process camera lens with variable focal length
[BMFT-FB-T-81-155] N82-15415
Evaporated As_2S_3 Luneburg lenses for $LiNbO_3$:Ti optical waveguides N82-15914
A liquid crystal adaptive lens N82-15921

LENSES
Perspective on precision machining, polishing, and optical requirements
[DE81-028006] N82-15244
Development of a process camera lens with variable focal length
[BMFT-FB-T-81-155] N82-15415
Construction of a numerically controlled device for aligning optical and mechanical axis of a microscope lens on a lathe
[BMFT-FB-T-81-033] N82-15924
Development of optical plastics
[BMFT-FB-T-81-121] N82-15927

LEPTONS
Neutrino number of the universe
[DE81-030249] N82-15875

LEVITATION
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15086

LIBRARIES
Analysis of responses to survey of DTIC's military users on current and planned technical library/information center automation
[AD-A105507] N82-15999

LIFE (DURABILITY)
Aeronautical applications of bonding
[SNIAS-812-551-102] N82-15010
Evaluation program for secondary spacecraft cells: Seventeenth annual report of cycle life test
[NASA-CR-165071] N82-15525

LIFE SCIENCES
Feasibility study (phase A) for a Life Science Double Rack envisaged for the Spacelab mission D1
[BMFT-FB-W-81-037] N82-15732
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79639] N82-15763

LIFE SUPPORT SYSTEMS
Evaluation of chemical protective facelets and comparison of four prototpyes
[IZF-1980-15] N82-15764

LIFT
High lift selected concepts
[NASA-CR-159093] N82-15017
Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation
N82-15045

LIFT DEVICES
Selected advanced aerodynamic and active control concepts development
[NASA-CR-3220] N82-15033

LIGHT (VISIBLE RADIATION)
Light depolarization as a measure of pavement surface texture
[PB81-241507] N82-15253
Visual problems in aviation and space navigation
N82-15758

LIGHT AIRCRAFT
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848

LIGHT ALLOYS
Advantages and limitations in the use of diverse materials for aircraft construction --- composite versus metallic materials
[SNIAS-811-551-104] N82-15011

LIGHT EMITTING DIODES
Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926
Transparent GaAlAs luminescent diodes for optical wavelength multiplexing
[BMVG-FBWT-79-18] N82-15938

LIGHT IONS
Low-energy X-ray emission from light ion targets
[DE81-026249] N82-15855
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15876

LIGHT MODULATION
High speed techniques for synthetic aperture radar image formation N82-15898
Matrix vector multiplier with time varying single dimensional spatial light modulators N82-15900
Monolithically integrated active optical devices -- with application in optical communication
N82-15916
Microchannel spatial light modulator N82-15917

LIGHT SCATTERING
An automatic light scattering CCN counter
N82-15394

LIGHT SOURCES
Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298
National synchrotron light source in the infrared region
[DE81-030037] N82-15932

LIGHT WATER REACTORS
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] N82-15563

LIGHTING EQUIPMENT
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements
[IZF-1980-1-VOL-1] N82-15081
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 2: Intensity measurements
[IZF-1980-12-VOL-2] N82-15082

LIGHTNING
Toward the assessment of the susceptibility of a digital system to lightning upset N82-15295

LIMITERS (FUSION REACTORS)
High-speed photographic observation of plasma-limiter interactions in ISX-B
[DE81-029669] N82-15427

LIMNOLOGY
Studies of the effects of operating the Mt. Elbert Pumped-Storage Powerplant on Twin Lakes, Colorado: 1979 report of findings
[PB81-240483] N82-15521

LINE SPECTRA
Atlas of absorption lines from 0 to 17 900 cm(-1)
[NASA-RP-1084] N82-15863

LINEAR CIRCUITS
Hybrid A/D converter for 200 deg C operation N82-15329

LINEAR PROGRAMMING
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] N82-16014

LINEAR SYSTEMS
Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

LINEAR VIBRATION
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067

LINGUISTICS
A Workshop on Qualitative Information Retrieval
[AD-A106867] N82-16000

LIQUEFACTION
Probabilistic analysis for liquefaction
[PB81-249724] N82-15263

LIQUEFIED NATURAL GAS
Liquid natural gas rapid phase transitions
[PB81-244774] N82-15232
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-029689] N82-15602

LIQUID CHROMATOGRAPHY
Journal of research of the National Bureau of Standards. Volume 86, no. 4, July - August 1981
[PB81-247017] N82-15164

LIQUID CRYSTALS
High speed techniques for synthetic aperture radar image formation N82-15898
A liquid crystal adaptive lens N82-15921

LIQUID HELIUM
Cryopumping of hydrogen and helium
[DE81-030553] N82-15246
Cycle design for the ISABELLE helium refrigerator
[DE81-030551] N82-15249
Analysis of cooldown performance for ISABELLE helium refrigerator
[DE81-030548] N82-15250
Steady-state heat transfer to boiling liquid helium in simulated coil windings
[DE81-028661] N82-15371

LIQUID HYDROGEN
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] N82-15542

LIQUID LITHIUM
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177

LIQUID PHASE EPITAXY
The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15962

LIQUID SURFACES
Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617

LIQUID WASTES
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636

LIQUID-LIQUID INTERFACES
Internal convection under low gravity due to orthogonal gradients of temperature and concentration
[BMFT-FB-W-81-041] N82-15089

LIQUID-SOLID INTERFACES
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826

LIQUIDS
Instrument for liquids, amorphous and power diffraction
[DE81-030135] N82-15421

LITHIUM CHLORIDES
Corrosion of type 316 stainless steel in molten LiF-LiCl-LiBr
[DE81-028633] N82-15172

LITHIUM COMPOUNDS
The electrochemistry of molten lithium chlorate and its possible use with lithium in a battery
[AD-A105968] N82-15145

LITHIUM FLUORIDES
Corrosion of type 316 stainless steel in molten LiF-LiCl-LiBr
[DE81-028633] N82-15172

LITHIUM ISOTOPES
Study of structure of nuclei with neutrons and nuclear data measurements for MFE
[DE81-026386] N82-15854

LITHOSPHERE
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] N82-15484

LIVER
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772

LOAD TESTS
Indentation law for composite laminates
[NASA-CR-165460] N82-15123
Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] N82-15605

LOADING RATE
Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473

LOADS (FORCES)
System analysis approach to deriving design criteria (Loads) for Space Shuttle and its payloads. Volume 2: Typical examples
[NASA-TP-1950] N82-15106
Experimental and theoretical study of a tall building subjected to wind loading
[DE81-029478] N82-15465
Calculation of the stresses and the finite deflections of a perfect circular cylinder subjected to non-axisymmetric loads
[KFK-CAD-165] N82-15471

LOCKS (FASTENERS)
Development on a new kind of microprocessor-based lock
[BMFT-FB-T-81-128] N82-15794

LOGIC CIRCUITS
Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317
High temperature LSI N82-15332

LOGIC DESIGN
High temperature LSI N82-15332

LONG DURATION EXPOSURE FACILITY
Investigations of micrometeorite impacts on large surfaces and during long-term missions
[TUM-RT-TB-80/12] N82-15090

LONG DURATION SPACE FLIGHT
USSR Space Life Sciences Digest
[NASA-TM-84060] N82-15708
Investigations of micrometeroid impacts in large areas and long duration missions
[BMFT-FB-W-81-031] N82-16032

LONG TERM EFFECTS
USSR report: Earth sciences, no. 18
[JPRS-79631] N82-15476
Model of Climate and Global Ecology N82-15477
Potential change in climate by year 2000 N82-15478
Climates of past as a model of future climate N82-15479

LOOK ANGLES (TRACKING)
New baseline system N82-1[illegible]
Squinted SAR system N82-1[illegible]

LOSSY MEDIA
Four- and five-layer silicon-clad dielectric waveguides N82-15911

LOW ALTITUDE
Detection of obstacles by low flying aircraft -- using CO2 laser; mathematical model
[FOA-C-30227-E1] N82-1[illegible]
Packaging techniques for low-altitude Venus balloons beacon N82-1[illegible]

LOW GRAVITY MANUFACTURING
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-1[illegible]
Investigation on the applicability of slip casting for the production of cermets under microgravity conditions
[BMFT-FB-W-81-017] N82-15091

LOW PRESSURE
The physiological effect of low-air-pressure anoxia N82-15748
Caisson disease N82-15749

LOW SPEED
Low-speed aerodynamic performance of a high-aspect-ratio supercritical-wing transport model equipped with full-span slat and part-span double-slotted flaps
[NASA-TP-1580] N82-15015

LOW SPEED STABILITY
Stability and flutter analysis of turbine blades at low speed N82-15050

LOW SPEED WIND TUNNELS
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15030

LOW TEMPERATURE ENVIRONMENTS
Minus 55 to plus 200 deg C 12 bit analog-to-digital converter N82-15327

LOW TEMPERATURE PHYSICS
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973
Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975

LUBRICANTS
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] N82-15453

LUBRICATION
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-151[illegible]

LUMINANCE
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 2: Intensity measurements
[IZF-1980-12-VOL-2] N82-15082
Continuing development of the DEROB system -- calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243

LUMINOUS INTENSITY
Continuously variable electrooptic filter
[DE81-025393] N82-1[illegible]

LUNG MORPHOLOGY
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772

M

MACHINE TOOLS
Minicomputer and computer numerical control maintenance
[DE81-030645] N82-1[illegible]

MACHINING
Perspective on precision machining, polishing, and optical requirements
[DE81-028008] N82-15244
Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-008] N82-15851

MAGNESIUM
Oxidation of metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15586

MAGNET COILS
On the efficiency of small air coil motors
[WTHD-131] N82-15303
Steady-state heat transfer to boiling liquid helium in simulated coil windings
[DE81-028561] N82-15371

MAGNETIC ANOMALIES
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] N82-15484
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures
[DE81-030700] N82-15582

MAGNETIC DOMAINS
Manipulation of light with magneto-optic stripe domain fields N82-15922

MAGNETIC EFFECTS
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345

MAGNETIC MIRRORS
Research on magneto-optical bias elements for laser gyros
[DFVLR-FB-81-21] N82-15417
Constance mirror program: Progress and plans
[NASA-CR-164804] N82-15942
Magnetic Confinement fusion plasma theory
[DE81-029789] N82-15943

MAGNETIC RECORDING
Digital recording of video signals on magnetic tape at 40 M bit/sec
[BMFT-FB-T-81-084] N82-15410

MAGNETIC RESONANCE
Investigation by means of laser magnetic resonance of the OH/HO2 reaction yielding H2O/O2
[MPIS-18A/1980] N82-15161

MAGNETIC SPECTROSCOPY
Multiparticle magnetic spectrometer with dE/dx and TRD particle identification
[DE81-030567] N82-15423

MAGNETIC STORMS
Sounding rocket program AERONOMY project: 'Polar High Atmosphere' mass spectrometer experiment — magnetic storm activity
[BMFT-FB-W-81-027] N82-15671

MAGNETIC SURVEYS
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15856

MAGNETIC SWITCHING
High voltage, magnetically switched pulsed power systems
[DE81-028290] N82-15347

MAGNETO-OPTICS
Research on magneto-optical bias elements for laser gyros
[DFVLR-FB-81-21] N82-15417
Manipulation of light with magneto-optic stripe domain fields N82-15922

MAGNETOHYDRODYNAMIC FLOW
The aerodynamics of bodies in a rarefied ionized gas with applications to spacecraft environmental dynamics
[NASA-TP-1933] N82-15116

MAGNETOHYDRODYNAMIC GENERATORS
Advanced solar energy conversion — solar pumped gas lasers
[NASA-CR-165080] N82-15526
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527

MAGNETOHYDRODYNAMIC STABILITY
High-speed photographic observation of plasma-limiter interactions in ISX-B
[DE81-029889] N82-15427
Constance mirror program: Progress and plans
[NASA-CR-164804] N82-15942
Equilibrium and stability of experimental high beta toroidal plasmas
[DE81-023810] N82-15944
Current driven nonideal instability in a force-free toroidal plasma
[DE81-029892] N82-15958
GATO: An MHD stability code for axisymmetric plasmas with internal separatrices
[DE81-029889] N82-15957
Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15961

MAGNETOHYDRODYNAMICS
Ultra-high-density plasma experiments: MHD simulations
[DE81-030244] N82-15954
Algorithms developed to obtain particular numerical solutions to the ideal MHD equilibrium problem
[DE81-029891] N82-15955

MAGNETORESISTIVITY
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] N82-15661

MAGNETOSPHERE
Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15658

MAGNIFICATION
Electron optical mask projector with a photocathode for miniaturization
[BMFT-FB-T-81-069] N82-15412

MAINTENANCE
Minicomputer and computer numerical control maintenance
[DE81-030645] N82-15800

MAN MACHINE SYSTEMS
Survey of the observer's performance with remotely piloted vehicles — on target recognition
[BMVG-FBWT-81-3] N82-15036
Simulator data on human error probabilities
[DE81-026094] N82-15786
Use of a television multipoint x-y tracker for determining the transmission of vibrations on human beings — human factors in man machine systems
N82-15787

MANAGEMENT
Management, planning, and implementation of medical operations N82-15731

MANAGEMENT INFORMATION SYSTEMS
Medical information management N82-15730

MANAGEMENT METHODS
Federal records management: A history of neglect
[PB81-237133] N82-15983
Managing large-scale models: DBS
[DE81-029883] N82-16006

MANAGEMENT PLANNING
The Airbus program: quality policy
[SNIAS-812-551-101] N82-15009
Technique for planning and managing industrial growth from the air-quality standpoint
[DE81-029342] N82-15614
Transit planning and management
[PB81-238032] N82-16017

MANAGEMENT SYSTEMS
The Airbus program: quality policy
[SNIAS-812-551-101] N82-15009
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 3: Program source files
[AD-A108104] N82-15286
Implementation and application of a set theoretical data base system
[BMFT-FB-DV-81-004] N82-15797

MANITOBA
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345

MANUALS
State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262

MANUFACTURING
Applications of composites in missiles and missile launchers N82-15126
Perspective on precision machining, polishing, and optical requirements
[DE81-028008] N82-15244
Integrated circuits for TV and radio applications
[BMFT-FB-T-81-088] N82-15279

MAPPING
The Atlas-C mission
[DFVLR-FB-81-19] N82-15113
The reduction, verification and interpretation of Magsat magnetic data over Canada
[E82-10006] N82-15484
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures
[DE81-030700] N82-15582

MARINE ENVIRONMENTS
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029680] N82-15507
Assessment report on the effects of waste dumping in 106-mile ocean waste disposal site: Dumpsite evaluation report
[PB81-241572] N82-15650
Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703

MARINE METEOROLOGY
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] N82-15684

MARKET RESEARCH
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] N82-15220

MARKING
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480

MARKOV PROCESSES
Projected Markov parameters and multivariable root-loci
[RR-148] N82-15839
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

MARS PHOTOGRAPHS
Viking lander imaging investigation during extended and continuation automatic missions. Volume 2: Lander 2 picture catalog of experiment data record
[NASA-RP-1068-VOL-2] N82-16028

MARTENSITIC STAINLESS STEELS
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029600] N82-15192

MARTENSITIC TRANSFORMATION
Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182
Effects of tensile deformation on the strain memory behavior of uranium-niobium alpha double prime martensite
[DE81-030285] N82-15184

MARTINGALES
On martingales and recursive optimal state estimation
[NLR-TR-80058-U] N82-15836

MASKING
Evaporated As2S3 Luneburg lenses for LiNbO3:Ti optical waveguides N82-15914

MASKS
Evaluation of chemical protective facelets and comparison of four prototpyes
[IZF-1980-15] N82-15784

MASS FLOW
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030038] N82-15604
MASS SPECTRA
The mass spectra and isotopic purity of compounds proposed for use in the master analytical scheme for the analysis of organic compounds in water
[PB81-229463] N82-15163
MASS SPECTROSCOPY
The mass spectra and isotopic purity of compounds proposed for use in the master analytical scheme for the analysis of organic compounds in water
[PB81-229463] N82-15163
Vaporization and chemical transport under coal gasification conditions
[PB81-245839] N82-15165
The mass spectrometer experiment in the program AEROS
[BMFT-FB-W-81-030] N82-15857
Sounding rocket program AERONOMY project: 'Polar High Atmosphere' mass spectrometer experiment — magnetic storm activity
[BMFT-FB-W-81-027] N82-15871
MASS TRANSFER
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] N82-15367
Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880
MATCHED FILTERS
Integrated filter for video color processing
[BMFT-FB-T-81-065] N82-15300
MATERIALS RECOVERY
Recovery of raw materials by pyrolysis
[BMFT-FB-T-81-017] N82-15141
MATHEMATICAL MODELS
An overview of several rain and attenuation models N82-15272
Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] N82-15492
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15560
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-029889] N82-15602
Community noise assessment manual: Strategy guidelines for developing a community noise control program
[PB81-244352] N82-15642
Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654
Methodology and basic algorithms of the Livermore Economic Modeling Systems
[DE81-029430] N82-15833
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013
MATHEMATICAL TABLES
Tabular aids for fitting Weibull moment estimates
[AD-A105865] N82-15842
MATRICES (MATHEMATICS)
The construction of an accurate lower bound for the real parts of the eigen values of an M-matrix
[MC-NW-102/81] N82-15827
An algorithm which determines the global least squares equidistant spline fit
[NLR-TR-80006-U] N82-15837
Study of structure of nuclei with neutrons and nuclear data measurements for MFE
[DE81-026088] N82-15854
Optical implementation of systolic array processing N82-15899
Matrix vector multiplier with time varying single dimensional spatial light modulators N82-15900
Incoherent optical matrix-matrix multiplier N82-15901

GATO: An MHD stability code for axisymmetric plasmas with internal separatrices
[DE81-029899] N82-15867
MEAN FREE PATH
Illustrative numerical comparisons between phonon mean free paths and phonon thermal conductivity
[DE81-029180] N82-15883
MEASUREMENT
NSS: Materials measurements
[NASA-CR-165078] N82-15121
MEASURING INSTRUMENTS
Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14838-1] N82-15361
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433
MECHANICAL DEVICES
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-15199
MECHANICAL DRIVES
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240487] N82-15453
MECHANICAL PROPERTIES
Advantages and limitations in the use of diverse materials for aircraft construction — composite versus metallic materials
[SNIAS-811-551-104] N82-15011
Temperature histories in geothermal wells: Survey of rock thermomechanical properties and drilling, production, and injection case studies
[DE81-029957] N82-15882
MECHANICAL SHOCK
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
MEDICAL ELECTRONICS
Remote Medical Diagnosis System (RMDS) utilization study
[AD-A105559] N82-15771
MEDICAL EQUIPMENT
Shuttle orbital medical system N82-15718
MEDICAL PERSONNEL
Management, planning, and implementation of medical operations N82-15731
MEDICAL SCIENCE
Crew medical training N82-15717
Fundamentals of aeronautical and aerospace medical science
[AD-A102296] N82-15736
The developmental history of aeronautical and aerospace medical science N82-15737
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79839] N82-15763
NASA biomedical Applications Team Advisory Center for Medical Technology and Systems
[NASA-CR-166755] N82-15770
Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773
MEDICAL SERVICES
Emergency Medical Services System (EMSS) N82-15716
Management, planning, and implementation of medical operations N82-15731
MEMBRANE STRUCTURES
Axisymmetric finite deformation membrane problems
[DE81-030070] N82-15464
MERCURY OXIDES
Energy storage systems for terrestrial solar generators — cadmium/mercury oxide cells
[BMFT-FB-T-81-082] N82-15529
MESOSCALE PHENOMENA
Status report on DOE-sponsored meteorological model validation program
[DP-MS-81-20] N82-15889
METABOLIC WASTES
Parallel evaluation of air-and oxygen-activated sludge
[PB81-248712] N82-15633
METAL AIR BATTERIES
Development of the aluminum-air battery for electric vehicle applications
[DE81-029446] N82-16010

METAL CUTTING
Technical and scientific research accompanying the projects on 'Needle Milling', including the determination of specific process parameters
[BMFT-FB-HA-81-005] N82-15447
METAL FATIGUE
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457
Evaluation of the crack initiation life behavior of fatigue loaded automotive components made from high strength aluminum alloys
[DFVLR-FB-81-10] N82-15459
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-150(1981)] N82-15460
METAL FILMS
Amorphous metallizations for high-temperature semiconductor device applications N82-15318
Ohmic contacts to GaAs for high-temperature device applications N82-15319
Low-cost mirror concentrator based on inflated, double-walled, metalized, tubular films
[DE81-027813] N82-15551
METAL FINISHING
On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-83] N82-15448
METAL OXIDE SEMICONDUCTORS
Semiconductor technology for VLSI: Plasma etching and high pressure oxidation
[BMFT-FB-T-81-115] N82-15304
METAL OXIDES
Predictive calculations of volatilities of metals and oxides in steam containing environments
[DE81-029636] N82-15186
METAL PARTICLES
Mechanistic studies of carbon monoxide reduction
[DE81-030063] N82-15157
METAL PLATES
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457
Free-surface velocity measurements of plates driven by reacting and detonating RX-03-BB and PBX-0404
[DE81-026776] N82-15466
METAL SHEETS
Pulsed-irradiation creep in nickel
[DE81-030078] N82-15187
METAL SURFACES
Mechanistic studies of carbon monoxide reduction
[DE81-030063] N82-15157
METAL VAPORS
Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15972
METAL WORKING
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-168] N82-15252
Technical and scientific research accompanying the projects on 'Needle Milling', including the determination of specific process parameters
[BMFT-FB-HA-81-005] N82-15447
Humanization of working places in the foundry by use of an automatic fettling equipment
[BMFT-FB-HA-81-004] N82-15781
METALLIC GLASSES
Superconducting critical current density as a probe of defects in metallic glasses
[DE81-028136] N82-15341
METALLIZING
Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317
Amorphous metallizations for high-temperature semiconductor device applications N82-15318
High temperature LSI N82-15332
METALLOGRAPHY
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15068
METALS
Effects of misalignment on mechanical behavior of metals in creep
[NASA-CR-165055] N82-15166
METEORITIC DAMAGE
Investigations of micrometeorite impacts on large surfaces and during long-term missions
[TUM-RT-TB-80/12] N82-15069

METEOROID DUST CLOUDS
Investigations of micrometeroid impacts in large areas and long duration missions
[BMFT-FB-W-81-031] N82-16032
METEOROID PROTECTION
Investigations of micrometeroid impacts in large areas and long duration missions
[BMFT-FB-W-81-031] N82-16032
METEOROIDS
Dangers of explosive decompression N82-15750
METEOROLOGICAL CHARTS
Meteorological data, volume 134, number 3: The evolution of the circulation pattern at the 100 mbar level for the years 1973 and 1974 illustrated by maps of monthly mean values — over the Northern Hemisphere
[ISSN-0342-4332] N82-15676
METEOROLOGICAL FLIGHT
Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission
[NASA-CR-166752] N82-15406
METEOROLOGICAL INSTRUMENTS
Cloud droplet measurement methods: A bibliography
[DFVLR-MITT-81-04] N82-15691
On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15694
METEOROLOGICAL PARAMETERS
Reports from the German Meteorological Service. Number 155: Two hundred years of meteorological observations at Hohenpeissenberg (1781-1980)
[ISSN-0072-4130] N82-15675
Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677
Yearbook A Meteorology volume 132
[KNMI-97-132] N82-15682
Precipitation
[KNMI-117-1981] N82-15683
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] N82-15684
Synoptic and upper air observations in the Netherlands, volume 25
[KNMI-142-25] N82-15686
The behavior of surface wind and thermodynamic fields in the presence of deep convection
[AD-A105695] N82-15687
Satellite observed plantetary albedo and its parameterization
[PB81-238974] N82-15688
Status report on DOE-sponsored meteorological model validation program
[DP-MS-81-20] N82-15689
A model for calculating the absorbed dose to populations taking local weather statistics into consideration — after nuclear reactor accidents
[FOA-C-40140-A3] N82-15692
METEOROLOGICAL SATELLITES
Meteorological satellites
[AD-A107427] N82-15110
Environmental satellite imagery, March 1981
[PB81-248049] N82-15698
METEOROLOGICAL SERVICES
Automated Pilot Advisory System
[NASA-TM-73296] N82-15027
METEOROLOGY
Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] N82-15499
METHANE
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] N82-15225
High-pressure solvent extraction of methane from geopressured fluids
[DE81-027713] N82-15227
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-029869] N82-15602
METHOD OF CHARACTERISTICS
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-16060
METHOD OF MOMENTS
Tabular aids for fitting Weibull moment estimates
[AD-A105865] N82-15842
METHODOLOGY
Some technical writing skills industry needs
N82-15987
Technical writing versus technical writing
N82-15988
Whys and hows of in-house writing N82-15989
Technical writing practically unified through industry N82-15990
The composing process in technical communication N82-15991
A case study of the influences of audience and purpose on the composing processes of an engineer
N82-15992
METHYL ALCOHOLS
Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154
The utilisation of alcohol in light duty diesel engines
[PB81-244469] N82-15452
METHYL COMPOUNDS
Chemical modification of TiO2 surfaces with methylsilanes and characterization by infrared absorption spectroscopy
[NASA-CR-165063] N82-15139
MICROANALYSIS
Microanalysis by electron-spinning spectrometer for material and process control in semiconductor technology
[BMFT-FB-T-80-193] N82-15160
Systems background in X-ray microanalysis
[DE81-027285] N82-15420
MICROBALANCES
The tapered element oscillating microbalance: A monitor for short-term measurement of fine aerosol mass concentration
[PB81-245219] N82-15434
MICROBEAMS
Applications of bent cylindrical mirrors to X-ray beamlines
[DE81-029918] N82-15936
MICROBIOLOGY
Medical microbiology of crewmembers
N82-15723
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79639] N82-15763
MICROCHANNELS
Microchannel spatial light modulator N82-15917
MICROCOMPUTERS
Microcomputer large-scale integration chips
[BMFT-FB-T-81-066] N82-15792
Microcomputer and LSI compatible power switch
[BMFT-FB-T-81-093] N82-15793
Using microcomputers to monitor the field performance of residential heat pumps
[PB81-240606] N82-15806
MICROELECTRONICS
Proceedings of the Conference on High-temperature Electronics
[NASA-TM-84069] N82-15311
Solid state microelectronics tolerant to radiation and high temperature — JFET thick film hybrids
N82-15331
Electron radiation system for structure production. Part 2: Equipment systems and design
[BMFT-FB-T-81-091-VOL-2] N82-15414
MICROHARDNESS
A bibliography of micro-hardness testing
[NPL-MOM-55] N82-15236
MICROMETEORITES
Investigations of micrometeorite impacts on large surfaces and during long-term missions
[TUM-RT-TB-80/12] N82-15090
MICROMINIATURIZATION
Components for mask technology — in printed circuit production
[BMFT-FB-T-81-055] N82-15351
MICROORGANISMS
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236461] N82-15645
Ecological and technological problem of biodamages N82-15766
Improving municipal and industrial waste treatment processes: Nutritional and physical conditions that regulate floc formation in bacteria isolated from activated sludge
[PB81-246282] N82-16018
MICROPROCESSORS
Integration of a digital air data computer into the test aircraft HFB-320
[DFVLR-MITT-81-09] N82-15036
Microcomputer large-scale integration chips
[BMFT-FB-T-81-066] N82-15792
Development on a new kind of microprocessor-based lock
[BMFT-FB-T-81-126] N82-15794
Iterative optical vector-matrix processors (survey of selected achievable operations) N82-15904
MICROSCOPY
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933
MICROSTRUCTURE
Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-026603] N82-15171
Precipitation and cavity formation in austenitic stainless steels during irradiation
[DE81-026082] N82-15174
Preirradiation microstructural development designed to minimize properties degradation during irradiation in austenitic alloys
[DE81-026612] N82-15180
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029836] N82-15182
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029760] N82-15189
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192
Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207
MICROWAVE ATTENUATION
Characteristics of rain and rain systems
N82-15271
An overview of several rain and attenuation models N82-15272
Prediction techniques N82-15275
MICROWAVE IMAGERY
Visual Evaluation of E-SLAR imagery
[DFVLR-FB-81-11] N82-15503
MICROWAVE RADIOMETERS
Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission
[NASA-CR-166752] N82-15406
MICROWAVES
Present possibilities for the use of microwaves in civil engineering: Bibliographical study
[LBC-95] N82-15235
Packaging techniques for low-altitude Venus balloons beacon N82-15336
MILITARY AIR FACILITIES
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements
[IZF-1980-1-VOL-1] N82-15081
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 2: Intensity measurements
[IZF-1980-12-VOL-2] N82-15082
MILLIMETER WAVES
Depolarization on Earth-space paths N82-15273
Propagation data bases N82-15274
MILLING (MACHINING)
Technical and scientific research accompanying the projects on 'Needle Milling', including the determination of specific process parameters
[BMFT-FB-HA-81-005] N82-15447
MILLING MACHINES
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-168] N82-15252
MINERAL EXPLORATION
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489

Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1169] N82-15556
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] N82-15525
MINERALOGY
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
MINES (EXCAVATIONS)
Development of tests and criteria to evaluate grounding systems
[PB81-238364] N82-15522
MINIATURIZATION
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437
MINNESOTA
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345
MINORITY CARRIERS
Control of the minority carrier lifetime of silicon devices using electron irradiation
[BMFT-FB-T-81-037] N82-15349
MIRROR FUSION
Progress toward fusion energy
[UCRL-84974] N82-15888
Hydrogen production based on magnetic fusion
[DE81-029536] N82-15948
MIRRORS
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] N82-15551
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933
Applications of bent cylindrical mirrors to X-ray beamlines
[DE81-029918] N82-15936
MIS (SEMICONDUCTORS)
On two-six thin film technology for the preparation of active luminescing areas
[BMFT-FB-T-81-118] N82-15144
Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535
MISALIGNMENT
Effects of misalignment on mechanical behavior of metals in creep
[NASA-CR-165055] N82-15166
MISSILE COMPONENTS
Groupe Matra Composites Conference — conference proceedings, Velizy, France, 24 Apr. 1981 N82-15126
Applications of composites in missiles and missile launchers N82-15128
MISSILE CONTROL
Microcomputer for attitude control systems
[BMFT-FB-W-81-040] N82-15112
MISSILE LAUNCHERS
Applications of composites in missiles and missile launchers N82-15128
MISSION PLANNING
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107
Management, planning, and implementation of medical operations N82-15731
MISSISSIPPI
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] N82-15496
MISSOURI RIVER BASIN (US)
Streamflow characteristics of the Hudson Bay and upper Missouri River Basins, Montana, through 1979
[PB81-247199] N82-15523
MOBILITY
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028368] N82-15544
MODEMS
A 16 QAM modem for a 140 Mbit/sec radio relay system
[FTZ-FI-21-TBR-20] N82-15269
MODULATION
Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14839-1] N82-15381
MODULATORS
A 16 QAM modem for a 140 Mbit/sec radio relay system
[FTZ-FI-21-TBR-20] N82-15269
MOISTURE CONTENT
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
MOLDS
Matra automobiles: Thellley center — molding of composites N82-15133
MOLECULAR EXCITATION
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446
Depopulation rates for combustion-related species in long-lived vibrationally or electronically excited levels
[DE81-030042] N82-15968
MOLECULAR GASES
Atlas of absorption lines from 0 to 17 900 cm(-1)
[NASA-RP-1084] N82-15853
MOLECULAR RELAXATION
Effects of reagent translational and vibrational energy on the dynamics of endothermic reactions
[DE81-028122] N82-15969
MOLECULAR SPECTROSCOPY
The ROSCOE manual. Volume 28-1: Molecular band model parameters for thermal emissions: Expanded wavelength coverage
[AD-A106077] N82-15659
MOLECULAR STRUCTURE
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735
Coulomb explosion of large penetrating molecular clusters
[DE81-025866] N82-15861
Computer simulation of organic and biological molecules — conferences
[DE81-029948] N82-15871
Development of optical plastics
[BMFT-FB-T-81-121] N82-15927
Preparation and molecular and crystal structure of trans-R.S.-(Cr(2, 3, 2-tet)(ncs)2) NCS
[AD-A105595] N82-15964
MOLTEN SALT ELECTROLYTES
Use of alkali metal-acid phosphates for elevated temperature water electrolysis
[DE81-029807] N82-15156
MOLTEN SALTS
Physical properties data compilations relevant to energy storage. 4: Molton Salts: Data on additional single and multi-component salt systems
[PB81-244121] N82-15162
MOLYBDENUM
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335
Shock-compression measurements at pressures greater than 1 TPa
[DE81-030113] N82-15372
MOMENT DISTRIBUTION
Force and moment coefficients for high deflection cascades — theory behind a computer program
N82-15046
MOMENTUM TRANSFER
Exclusive processes in quantum chromodynamics
[DE81-028233] N82-15151
MONITORS
Evaluation of air cleaning and monitoring equipment used in recirculation systems
[PB81-242695] N82-15788
MONOCHROMATORS
Polarizing multilayer spectrometer for neutrons
[DE81-029546] N82-15878
MOSAICS
Environmental satellite imagery, March 1981
[PB81-248049] N82-15698
MOTION SICKNESS
STS-1 medical report
[NASA-TM-58240] N82-15711
Validation of predictive tests and countermeasures for space motion sickness N82-15719
The effects of rotation and oscillation: Aerial sickness N82-15744
MOTION SICKNESS DRUGS
The effects of rotation and oscillation: Aerial sickness N82-15744
MOTION SIMULATORS
The Link-Miles driver training simulator for tracked vehicles: Influence of cabin motion on gear-change learning
[IZF-1980-24] N82-15795
MOTIVATION
The composing process in technical communications N82-15[illegible]
MOTOR VEHICLES
Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019
MULTIPLEXING
Transparent GaAlAs luminescent diodes for optical wavelength multiplexing
[BMVG-FBWT-79-18] N82-15[illegible]
MULTIPLICATION
E-beam generated holographic masks for optical vector-matrix multiplication N82-15919
MULTISPECTRAL BAND SCANNERS
Laboratory and field portable system for calibrating airborne multispectral scanners
[DE81-029740] N82-15429
MULTISPECTRAL PHOTOGRAPHY
Earth feature identification for onboard multispectral data editing: Computational experiments
N82-15[illegible]
MULTIVARIATE STATISTICAL ANALYSIS
Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures — crop acreage estimation
[E82-10013] N82-15491
MUONS
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973
MUSCULOSKELETAL SYSTEM
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772

N

N-P-N JUNCTIONS
Process characteristics and design methods for a 300 deg quad OP amp N82-15328
N-TYPE SEMICONDUCTORS
Ohmic contacts to GaAs for high-temperature device applications N82-15319
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569
NAPHTHENES
Thermolysis of naphthols
[DE81-029684] N82-15152
NASA PROGRAMS
Index to NASA News Releases and Speeches, 1980 N82-15985
NASA: Technology transfer
[NASA-TM-84070] N82-16009
NASTRAN
NASTRAN user's guide (Level 17.5)
[NASA-CR-3146] N82-15456
NATIONAL SEVERE STORMS PROJECT
National Hurricane operations plan
[PB81-247231] N82-15697
NEGATIVE IONS
Coulomb explosion of large penetrating molecular clusters
[DE81-025866] N82-15861
NEODYMIUM ISOTOPES
Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970
NEODYMIUM LASERS
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437

NETHERLANDS
Network for the measurement of the chemical composition of precipitation in the Netherlands
[KNMI-159-3] N82-15881
Yearbook A Meteorology volume 132
[KNMI-87-132] N82-15882
Synoptic and upper air observations in the Netherlands, volume 24
[KNMI-142-24] N82-15885
Synoptic and upper air observations in the Netherlands, volume 25
[KNMI-142-25] N82-15886

NETWORK SYNTHESIS
Panel D report: Standards needed to interconnect ADS pilots for data sharing in data formats and descriptions N82-15104

NEUTRAL BEAMS
Improvement of gas efficiency of negative ion sources
[DE81-029031] N82-15862

NEUTRINOS
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857
Neutrino number of the universe
[DE81-030249] N82-15875

NEUTRON ACTIVATION ANALYSIS
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029822] N82-15772

NEUTRON COUNTERS
Wireless, in-vessel neutron monitor for initial core-loading of advanced breeder reactors
N82-15330
Design of neutron streak camera for fusion diagnostics
[DE81-029666] N82-15426

NEUTRON CROSS SECTIONS
Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970

NEUTRON EMISSION
the 165Ho + 56Fe reaction at E sub lab = 482 MeV N82-15886
Space-resolved measurements of neutrons and ions emitted by a plasma focus
[IPF-80-8] N82-15940
Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15961

NEUTRON FLUX DENSITY
Design of neutron streak camera for fusion diagnostics
[DE81-029666] N82-15426

NEUTRON IRRADIATION
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15189
Effects of transmutation products on swelling in 316 stainless steel
[DE81-029805] N82-15190
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79639] N82-15763
Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-026143] N82-15974

NEUTRON SCATTERING
Selected topics in thermal and resonance neutron capture
[DE81-029676] N82-15864
Phonons in graphite intercalation compounds measured by neutron scattering
[DE81-029681] N82-15868
Neutron scattering studies of quasi one- and two-dimensional hydrogen-bonded ferroelectrics
[DE81-030334] N82-15978

NEUTRON SPECTRA
Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970

NEUTRON SPECTROMETERS
Polarizing multilayer spectrometer for neutrons
[DE81-029546] N82-15678

NEVADA
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506

NEW MEXICO
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] N82-15661

NEW ZEALAND
Feasibility of electric vehicles in New Zealand
[DE81-903384] N82-16011

NICKEL
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
Pulsed-irradiation creep in nickel
[DE81-030078] N82-15187
Stress dependence of creep in Ni bombarded with 17-MeV deuterons
[DE81-030080] N82-15869

NICKEL ALLOYS
High-temperature fatigue life of type 316 stainless steel containing irradiation induced helium
[DE81-028879] N82-15170
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

NICKEL CADMIUM BATTERIES
Experimental study for rechargeable sealed Ni/Cd watch batteries
[BMFT-FB-T-81-129] N82-15586

NICKEL OXIDES
Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes
[BMFT-FB-T-81-053] N82-15585

NICKEL PLATE
Development and testing of a low waste nickel plating process
[BMFT-FB-T-81-046] N82-15194

NICKEL STEELS
Interfacial structures in nickel-based transition joints after long term service
[DE81-903971] N82-15155

NICKEL-IRON BATTERIES
Nickel-iron battery of high energy density
[BMFT-FB-T-81-100] N82-15531

NIOBIUM
Testing results of MF-Nbsub3Sn
[DE81-026632] N82-15135
Slip systems and solid solution softening/hardening in BCC metals
[DE81-028883] N82-15179
Comparison of hydrostatic extrusion versus wire drawing as a method of producing Nbsub3Sn superconducting wire
[DE81-030275] N82-15251
Superconducting current densities in bronze-processed Nb3Sn multifilamentary wires
[DE81-030566] N82-15344

NIOBIUM COMPOUNDS
Effects of tensile deformation on the strain memory behavior of uranium-niobium alpha double prime martensite
[DE81-030285] N82-15184

NIOBIUM OXIDES
In-situ electron microscope fracture studies of amorphous films
[DE81-026141] N82-15971

NITRIC OXIDE
Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] N82-15606

NITRIDING
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15086
Nitridation of silicon
[NASA-TM-82722] N82-15197

NITROGEN
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] N82-15233
Preprototype nitrogen supply subsystem development
[NASA-CR-166192] N82-15780

NITROGEN OXIDES
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029653] N82-15607
Compilation of air pollutant emission factors: Highway mobile sources
[PB81-236305] N82-15636

NITROMETHANE
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-026426] N82-15845

NITROSAMINE
Workshop on indoor air quality research needs
[DE81-026466] N82-15612

NOCTURNAL VARIATIONS
Experimental design and data of the August 1980 Corral Gulch nocturnal wind experiment, Piceance Basin, northwestern Colorado
[DE81-026665] N82-15690

NOISE (SOUND)
Noise and sense of hearing N82-15747

NOISE INTENSITY
Cabin acoustical noise N82-15726

NOISE MEASUREMENT
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243006] N82-15634
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850

NOISE POLLUTION
Results of the Third International Congress on Noise Effects: As a public health problem; biological disturbances; effects on behavior
[BMFT-FB-HA-81-013] N82-15597
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243006] N82-15634
Community noise assessment manual: Social survey workbook
[PB81-244360] N82-15635
Community noise assessment manual: Computer programs for the Strategy Guidelines for Developing a Community Noise Control Program
[PB81-243024] N82-15641
Community noise assessment manual: Strategy guidelines for developing a community noise control program
[PB81-244352] N82-15642
Noise and sense of hearing N82-15747

NOISE PREDICTION (AIRCRAFT)
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848

NOISE REDUCTION
Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15378
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243006] N82-15634
Community noise assessment manual: Computer programs for the Strategy Guidelines for Developing a Community Noise Control Program
[PB81-243024] N82-15641
Community noise assessment manual: Strategy guidelines for developing a community noise control program
[PB81-244352] N82-15642
Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-008] N82-15851

NOMENCLATURES
Definitions of CAMAC terms
[DE81-028247] N82-15801

NONDESTRUCTIVE TESTS
Feasibility study of deformation modes of deforming composite materials using visioplasticity method
[NASA-CR-165067] N82-15125
Present possibilities for the use of microwaves in civil engineering: Bibliographical study
[LBC-95] N82-15235
A bibliography of micro-hardness testing
[NPL-MOM-55] N82-15236

Detection of flaws in reinforcing steel in prestressed concrete bridge members
[PB81-241680] N82-15258

NONFLAMMABLE MATERIALS
The effect of fire retardants on the heat-release rate of building materials
[PB81-229467] N82-15259

NONLINEAR SYSTEMS
Thermomechanical response of Gr/PI composites
[NASA-CR-165753] N82-15124
Nonlinear steady-state coupling of LH waves
[DE81-029436] N82-15946

NONLINEARITY
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067
Characterization of GaAs superhigh frequency field effect power transistors in the nonlinear mode
[ENST-E-81001] N82-15352

NONPARAMETRIC STATISTICS
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

NORMAL DENSITY FUNCTIONS
NOSS-SCAT wind direction alias removal
[NASA-CR-166069] N82-15680
The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885

NORTH AMERICA
Archaeoastronomy in the Americas — conference
[BP-AP-22] N82-16023

NORTH CAROLINA
Review and update of modeling analysis of carbon monoxide emissions in Mecklenburg County, North Carolina
[PB81-248841] N82-15639

NORTH SEA
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-26] N82-15684

NORTHERN HEMISPHERE
Meteorological data, volume 134, number 3: The evolution of the circulation pattern at the 100 mbar level for the years 1973 and 1974 illustrated by maps of monthly mean values — over the Northern Hemisphere
[ISSN-0342-4332] N82-15676

NOSE CONES
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850

NOSE TIPS
Stability measuring and dispersion of shells with different lengths of low aerodynamic drag tip
[FOA-C-20418-D2] N82-15022

NOTCH SENSITIVITY
Notch tensile behavior of irradiated 20 percent cold-worked Type 316 stainless steel
[DE81-026170] N82-15161

NOZZLE FLOW
DONBOL: A computer program for predicting axisymmetric nozzle afterbody pressure distributions and drag at subsonic speeds
[NASA-TM-78779] N82-15016

NUCLEAR CAPTURE
Selected topics in thermal and resonance neutron capture
[DE81-029676] N82-15864
Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970

NUCLEAR DEFORMATION
Axisymmetric finite deformation membrane problems
[DE81-030070] N82-15464

NUCLEAR ELECTRIC POWER GENERATION
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] N82-15454

NUCLEAR EXPLOSION EFFECT
Evaluation of infrared simulation data
[AD-A105872] N82-15931

NUCLEAR EXPLOSIONS
An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15660

NUCLEAR FISSION
Heavy-ion fusion revisited N82-15884

NUCLEAR FUEL BURNUP
Fuel-performance-improvement program
[DE81-029817] N82-15218

NUCLEAR FUELS
Fuel-performance-improvement program
[DE81-029817] N82-15218
Advanced Gamma Scan System Software package reference manual
[DE81-028094] N82-15819

NUCLEAR FUSION
Heavy-ion fusion revisited N82-15884
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
Magnetic Confinement fusion plasma theory
[DE81-029789] N82-15943

NUCLEAR INTERACTIONS
Hypernuclei and interactions of kaons with nuclei
[DE81-028467] N82-15856

NUCLEAR ISOBARS
Dynamics of hadron-nucleus interactions
[DE81-026272] N82-15858

NUCLEAR PARTICLES
Determination of nuclear-matter temperature and density
[DE81-023847] N82-15865
Polynomial chromodynamics
[DE81-028038] N82-15890

NUCLEAR PHYSICS
Determination of nuclear-matter temperature and density
[DE81-023847] N82-15865
University of Washington nuclear physics data collection system
[DE81-028321] N82-15889

NUCLEAR POWER PLANTS
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] N82-15598
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599

NUCLEAR REACTIONS
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Correlated mass and charge transport induced by statistical nucleon exchange in damped nuclear reactions N82-15880
Dissipative reaction dynamics of heavy-ion collisions N82-15881
Reaction parameters for heavy-ion collisions N82-15883
The 209Bi + 136Xe reaction at E sub lab = 1422 MeV N82-15885

NUCLEAR REACTORS
Development and adaptation of conduction and radiation heat-transfer computer codes for the CFTL
[DE81-028033] N82-15369
A model for calculating the absorbed dose to populations taking local weather statistics into consideration — after nuclear reactor accidents
[FOA-C-40140-A3] N82-15692
Comparison of computer codes (CE-THERM, FRAP-T5, GT3-FLECHT, and TRUMP-FLECHT) with data from the NRU-LOCA thermal hydraulic tests
[DE81-028136] N82-15817

NUCLEAR STRUCTURE
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15876

NUCLEATION
The Third International Cloud Condensation Nuclei Workshop — conference
[NASA-CP-2212] N82-15383
Contribution to CCN Workshop report from University of Wyoming group N82-15384
Description and discussion of the NRL TGDCC N82-15385
UMR dual mode CCN counter (modes: CFD plus haze) N82-15387
A cloud condensation nucleus spectrometer designed for airborne measurements N82-15388
Static diffusion cloud chambers N82-15389
An airborne isothermal haze chamber N82-15390
A description of the UK Meteorological Office CCN counter N82-15391
Cloud condensation nucleus counter by impactor sampling technique N82-15392
Diffusion tube N82-15393
An automatic light scattering CCN counter N82-15394
Description of the NRL isothermal haze chamber N82-1539
Modified MEE industries static thermal gradient diffusion cloud chamber N82-1539
Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397
CCN comparisons of static diffusion chambers N82-15399
CCN-supersaturation spectra slopes (k) N82-15400
Review of isothermal haze chamber performance N82-15403
Elemental composition of aerosols in fourteen experiments of the Cloud Condensation Nuclei Workshop N82-15405
Comparison between two Aitken counters and with cloud condensation nuclei counters at the 1980 International CCN Workshop N82-15408

NUCLEI
Non-linear vacuum polarization in strong fields
[DE81-028039] N82-15892

NUCLEON-NUCLEON INTERACTIONS
Dynamics of hadron-nucleus interactions
[DE81-026272] N82-15858
Studies of heavy-ion reactions and transuranic nuclei
[DE81-027980] N82-15879
Dissipative reaction dynamics of heavy-ion collisions N82-15881

NUCLEON-NUCLEON SCATTERING
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15876

NUCLEOTIDES
Computer simulation of organic and biological molecules — conferences
[DE81-029946] N82-15871

NUMERICAL ANALYSIS
Monolithically integrated active optical devices — with application in optical communication N82-15916
Current driven nonideal instability in a force-free toroidal plasma
[DE81-029892] N82-15956

NUMERICAL CONTROL
Microcomputer for attitude control systems
[BMFT-FB-W-81-040] N82-15112
Micro-processor-control for cutting machines
[BMFT-FB-T-81-142] N82-15239
Methods for linking item parameters
[AD-A105509] N82-15779
Minicomputer and computer numerical control maintenance
[DE81-030645] N82-15800
Definitions of CAMAC terms
[DE81-028247] N82-15801
Development of a computerized measuring system for quantitative digital image analysis interactive Image Analysis System (IBAS)
[BMFT-FB-T-81-035] N82-15820
Construction of a numerically controlled device for aligning optical and mechanical axis of a microscope lens on a lathe
[BMFT-FB-T-81-033] N82-15924

NUTRITIONAL REQUIREMENTS
STS-1 medical report
[NASA-TM-58240] N82-15711
Food and nutrition N82-15724

NYQUIST DIAGRAM
Computer program for computing and plotting Bode, phase, and Nyquist diagrams and time responses of given frequency transfer functions
[LEOK-TR-1979-13] N82-15815

O

OCEAN BOTTOM
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705

OCEAN CURRENTS
Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

OCEAN DATA ACQUISITIONS SYSTEMS
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] N82-15508

OCEAN DYNAMICS
Water waves generated by three dimensional bed motion: Abstract
[PB81-236172] N82-15674

OCEAN MODELS
Global ocean tides. Part 7: The diurnal principal solar tide (P1), atlas of tidal charts and maps
[AD-A105612] N82-15700

OCEAN SURFACE
Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699
HF radar measurements of surface currents in the German Bight during MARSEN phase 2
[PB81-244410] N82-15707

OCEAN THERMAL ENERGY CONVERSION
Environmental programs for Ocean Thermal Energy Conversion (OTEC)
[DE81-028876] N82-15570
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] N82-15580

OCEANOGRAPHIC PARAMETERS
Environmental programs for Ocean Thermal Energy Conversion (OTEC)
[DE81-028876] N82-15570
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] N82-15684

OCEANS
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706

OIL EXPLORATION
Geologic applications of thermal-inertia mapping from satellite — Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489

OIL POLLUTION
Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596
Performance testing of the Soviet oil/debris skimmer
[PB81-244790] N82-15644
Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise
[PB81-246068] N82-15704

OIL RECOVERY
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] N82-15508
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] N82-15509
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] N82-15637

OIL SLICKS
Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise
[PB81-246068] N82-15704

ON-LINE SYSTEMS
A Workshop on Qualitative Information Retrieval
[AD-A105897] N82-16000

ONBOARD DATA PROCESSING
Earth feature identification for onboard multispectral data editing: Computational experiments
N82-15896

ONBOARD EQUIPMENT
Shuttle orbital medical system N82-15718

OPACITY
The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627

OPERATIONAL HAZARDS
An evaluation of engineering control technology for spray painting
[PB81-243123] N82-15789

OPERATIONAL PROBLEMS
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10006] N82-15463
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495

OPERATIONS RESEARCH
Analysis of heuristics for stochastic programming: Results for hierarchical scheduling problems
[MC-BUT-142/81] N82-15816

OPERATOR PERFORMANCE
Survey of the observer's performance with remotely piloted vehicles — on target recognition
[BMVG-FBWT-81-3] N82-15036
The Link-Miles driver training simulator for tracked vehicles: A validation study
[IZF-1979-23] N82-15080

OPERATORS (MATHEMATICS)
On the choice of suitable operators and parameters in multigrid methods — for solving elliptic boundary value problems
[MC-NW-107/81] N82-15829

OPTICAL COMMUNICATION
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437
Laser diode
[BMFT-FB-T-81-151] N82-15439
AlGaAs/GaAs transverse junction stripe lasers with distributed feedback N82-15913

OPTICAL CORRECTION PROCEDURE
Theoretical study of image spots with the wide field camera and the implications for nebular spectrography — computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15939
Three Mirror Anastigmatic (TMA) telescope for observation of faint objects in the ultraviolet (1200 to 1800 A) applied in the GLASAR experiment — mirror optimization N82-16025

OPTICAL COUPLING
Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298

OPTICAL DATA PROCESSING
Integrated filter for video color processing
[BMFT-FB-T-81-085] N82-15300
Optical Information Processing for Aerospace Applications
[NASA-CP-2207] N82-15894
Air Force research in optical processing
N82-15895
Earth feature identification for onboard multispectral data editing: Computational experiments
N82-15896
Role of optical computers in aeronautical control applications N82-15897
High speed techniques for synthetic aperture radar image formation N82-15898
Optical implementation of systolic array processing
N82-15899
Matrix vector multiplier with time varying single dimensional spatial light modulators N82-15900
Incoherent optical matrix-matrix multiplier
N82-15901
Energy normalization of TV viewed optical correlation (automated correlation plane analyzer for an optical processor) N82-15903
Iterative optical vector-matrix processors (survey of selected achievable operations) N82-15904
Interferometric surface-wave acousto-optic time-integrating correlators N82-15905
Three methods for performing Hankel transforms
N82-15906
Optical recognition of statistical patterns
N82-15907
Optical Spatial integration methods for ambiguity function generation N82-15908
The integrated optic RF spectrum analyzer
N82-15909
Applications of electro-optic gratings in integrated optical signal processing devices N82-15910
Four- and five-layer silicon-clad dielectric waveguides N82-15911
CO2 laser waveguiding in proton implanted GaAs
N82-15912
E-beam generated holographic masks for optical vector-matrix multiplication N82-15919
Multifacet holographic optical elements
N82-15920
Manipulation of light with magneto-optic stripe domain fields N82-15922

OPTICAL DEPOLARIZATION
Light depolarization as a measure of pavement surface texture
[PB81-241507] N82-15253

OPTICAL EQUIPMENT
Perspective on precision machining, polishing, and optical requirements
[DE81-028006] N82-15244

OPTICAL FILTERS
Continuously variable electrooptic filter
[DE81-025393] N82-15934

OPTICAL HETERODYNING
The signal to noise ratio of a heterodyne laser detection system
[PHL-1980-11] N82-15438
Bulk and integrated acousto-optic spectrometers for radio astronomy N82-15902
A broadband RF continuously variable time delay device — using Bragg cell and optical heterodyne technology for signal processing N82-15915

OPTICAL MEASUREMENT
Investigation of a coherent optical method for roughness measurements
[BMFT-FB-T-81-065] N82-15923
Optical analysis and alignment applications using the infrared Smartt interferometer
[DE81-030257] N82-15937

OPTICAL MICROSCOPES
Construction of a numerically controlled device for aligning optical and mechanical axis of a microscope lens on a lathe
[BMFT-FB-T-81-033] N82-15924
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933

OPTICAL PROPERTIES
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements
[IZF-1980-1-VOL-1] N82-15081
Perspective on precision machining, polishing, and optical requirements
[DE81-028006] N82-15244

OPTICAL PUMPING
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437

OPTICAL RADAR
The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627

OPTICAL REFLECTION
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933

OPTICAL WAVEGUIDES
Investigation of semiconductor clad optical waveguides
[NASA-CR-165074] N82-15278
Optical Information Processing for Aerospace Applications
[NASA-CP-2207] N82-15894
The integrated optic RF spectrum analyzer
N82-15909
Applications of electro-optic gratings in integrated optical signal processing devices N82-15910
Four- and five-layer silicon-clad dielectric waveguides N82-15911
CO2 laser waveguiding in proton implanted GaAs
N82-15912
Evaporated As2S3 Luneburg lenses for LiNbO3:Ti optical waveguides N82-15914

OPTIMAL CONTROL
Study of the structure of a process control system consisting of units for signal processing, operator stations and process computer
[BMFT-FB-T-81-135] N82-15280
Optimal mix of adjustments to floods
[PB81-240533] N82-15511

OPTIMIZATION
Optimizing development of a bipolar stepping motor with electronic circuit for quartz analogue clocks
[BMFT-FB-T-81-077] N82-15299
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter — turbomachinery applications
[MITT-79-04] N82-15429

Analysis of heuristics for stochastic programming: Results for hierarchical scheduling problems
[MC-OUT-142/81] N82-15816
On martingales and recursive optimal state estimation
[NLR-TR-80088-U] N82-15838
Properties of stochastic labeling procedures — optimization model
[FOA-C-30229-E1] N82-15843

OPTIONS
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013

ORBIT TRANSFER VEHICLES
Satellite Power System: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238] N82-15524

ORBITAL POSITION ESTIMATION
Analysis of Meteorological Satellite location and data collection system concepts
[NASA-CR-166763] N82-15679

ORGANIC COMPOUNDS
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-236578] N82-15148
The mass spectra and isotopic purity of compounds proposed for use in the master analytical scheme for the analysis of organic compounds in water
[PB81-238453] N82-15163
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433

OSCILLATORS
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320

OUTGASSING
Shuttle toxicology N82-15726

OUTLET FLOW
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365

OVERPRESSURE
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365

OXIDATION
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15066
Semiconductor technology for VLSI: Plasma etching and high pressure oxidation
[BMFT-FB-T-81-115] N82-15304
Oxidation of metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15566
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029653] N82-15607
Disequilibrium of hydrogen sulfide in ground water by aeration
[PB81-244717] N82-15628

OXIDATION RESISTANCE
Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200

OXIDE FILMS
Dissolution of surface oxide layers on titanium and titanium subhydride between 25 and 700 C
[DE81-026044] N82-15136

OXYGEN
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527
Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-028143] N82-15974

OXYGEN ATOMS
Investigation by means of laser magnetic resonance of the OH/HO2 reaction yielding H2O/O2
[MPIS-18A/1980] N82-15161

OXYGEN CONSUMPTION
The physiological effect of low-air-pressure anoxia N82-15748

OXYGEN ISOTOPES
Study of structure of nuclei with neutrons and nuclear data measurements for MFE
[DE81-028368] N82-15854

OXYGEN METABOLISM
Oxygen toxication N82-15751

OZONE
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-236578] N82-15148

OZONOMETRY
The CHON photochemistry of the troposphere: GRASSLANDS project (summer colloquium 1980)
[PB81-233140] N82-15672

P

P WAVES
Complexity of short period P seismograms: What does scattering contribute?
[AWRE-O-3/81] N82-15653

P-N JUNCTIONS
Derivative measurement system for current-voltage and light-current-voltage characteristics — of double-heterostructure lasers
[FTZ-FI-512-TBR-6] N82-15293
Advanced planar silicon test structures
[PB81-229155] N82-15353

P-N-P JUNCTIONS
Process characteristics and design methods for a 300 deg quad OP amp N82-15328

PACKET SWITCHING
Fault detection and surveillance for a link in a data transmission network
[ENST-D-80010] N82-15289
Development of an X.25 protocol converter
[BMFT-FB-DV-81-002] N82-15796

PACKETS (COMMUNICATION)
Development of an X.25 protocol converter
[BMFT-FB-DV-81-002] N82-15796

PAIN
New approaches to treatment of chronic pain: A review of multidisciplinary pain clinics and pain centers
[PB81-240913] N82-15778

PAINTS
Recycling plant for paint sludges
[BMFT-FB-T-81-125] N82-15203
An evaluation of engineering control technology for spray painting
[PB81-243123] N82-15789

PARABOLOID MIRRORS
Three Mirror Anastigmatic (TMA) telescope for observation of faint objects in the ultraviolet (1200 to 1800 A) applied in the GLASAR experiment — mirror optimization N82-16025

PARACHUTES
Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024

PARALLEL FLOW
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062

PARALLEL PROCESSING (COMPUTERS)
Incoherent optical matrix-matrix multiplier N82-15901

PARAMETER IDENTIFICATION
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165057] N82-15032
Practical experience with a noncontact blade vibration measuring system in industrial turbocompressors — vibration mode identification N82-15065
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380
Spectral response measurements for solar cells
[DE81-030097] N82-15568

PARAMETERIZATION
Satellite observed plantetary albedo and its parameterization
[PB81-238974] N82-15666
Methods for linking item parameters
[AD-A105509] N82-15779

PARAMETRIC AMPLIFIERS
Introduction to the calculation of parametrically excited oscillations
[ISBN-3-7983-5150-3] N82-15294

PARITY
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877

PARTICLE ACCELERATOR TARGETS
Production and destruction of D(-) by charge transfer in metal vapors
[DE81-028134] N82-15872
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973

PARTICLE ACCELERATORS
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949
MAGCOOL: The production cooling facility for ISABELLE magnets
[DE81-030554] N82-15[illegible]

PARTICLE BEAMS
Possible applications of the steering of charged particles by bent single crystals
[DE81-028601] N82-15966

PARTICLE COLLISIONS
Continuum capture in the three-body problem
[DE81-025467] N82-15980

PARTICLE DENSITY (CONCENTRATION)
An automatic light scattering CCN counter N82-15394
Modified MEE Industries static thermal gradient diffusion cloud chamber N82-15396
Steady generation of aerosols with an improved constant output atomizer N82-15398
CCN comparisons of static diffusion chambers N82-15399
Performance of the continuous flow diffusion chambers N82-15402
Comparison between two Aitken counters and with cloud condensation nuclei counters at the 1980 International CCN Workshop N82-15406
Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677
Determination of nuclear-matter temperature and density
[DE81-023847] N82-15865

PARTICLE DIFFUSION
Contribution to CCN Workshop report from University of Wyoming group N82-15384
Description and discussion of the NRL TGDCC N82-15385
The CCN counter of the IOPG of Puy de Dome: Main characterisics and results of measurements N82-15386
CCN comparisons of static diffusion chambers N82-15399
Performance of the continuous flow diffusion chambers N82-15402
Aerosol generation and distribution system for the Third International Cloud Condensation Nuclei Workshop N82-15404
Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973

PARTICLE EMISSION
Air pollution emissions inventory systems. Appendix C: Emissions inventory in the Federal Republic of Germany
[PB81-242232] N82-15631
Review and update of modeling analysis of carbon monoxide emissions in Mecklenburg County, North Carolina
[PB81-248841] N82-15639
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857
A two dimensional position sensitive deltaE-E counter for energetic light charged particles N82-15862

PARTICLE ENERGY
Data evaluation and data processing of the low-energy particle spectrometer E8 on board the HELIOS probes
[BMFT-FB-W-81-035] N82-15416

PARTICLE INTERACTIONS
Polynomial chromodynamics
[DE81-028036] N82-15880
PARTICLE MOTION
Dynamic shear-wave velocity measurements using interferometric techniques
[DE81-026973] N82-15467
PARTICLE PRODUCTION
Multiparticle magnetic spectrometer with dE/dx and TRD particle identification
[DE81-030567] N82-15423
PARTICLE SIZE DISTRIBUTION
Photothermal spectroscopy of aerosols
[DE81-026096] N82-15150
Raman-scattering gas temperature measurements in particle-laden flows
[DE81-029621] N82-15370
The Third International Cloud Condensation Nuclei Workshop — conference
[NASA-CP-2212] N82-15383
CCN-supersaturation spectra slopes (k) N82-15400
Measurement of the aerosol size distribution with NRL's mobility analyzer N82-15401
Comparing dry aerosol size measurements N82-15407
A simple inversion method for determining aerosol size distributions — using light measurements
[FOA-C-30231-E] N82-15836
PARTICLES
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609
PARTICULATE SAMPLING
Water resources data for Idaho, water year 1980. Volume 2: Upper Columbia River Basin and Snake River Basin below King Hill
[PB81-244196] N82-15518
X-ray methods for the chemical characterization of atmospheric aerosols
[DE81-028874] N82-15603
The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627
PATTERN RECOGNITION
Design and performance of the new cathode readout proportional chambers in LASS
[DE81-026097] N82-15422
Development and evaluation of an automatic labeling technique for spring small grains
[E82-10001] N82-15480
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] N82-15485
Air Force research in optical processing N82-15895
Optical recognition of statistical patterns N82-15907
Summary of the Graphic Information Display Session
[DE81-028231] N82-16003
PAVEMENTS
Light depolarization as a measure of pavement surface texture
[PB81-241507] N82-15253
State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262
PAYLOAD INTEGRATION PLAN
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165068] N82-15115
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117
PAYLOADS
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495
PDP 11 COMPUTER
University of Washington nuclear physics data collection system
[DE81-026321] N82-15889
PELLETS
Fuel-performance-improvement program
[DE81-029817] N82-15218
Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549
PENETRATION
Hull/EPIC3 linked Eulerian/Lagrangian calculation in three dimension
[AD-A106033] N82-15368
PEPTIDES
Computer simulation of organic and biological molecules — conferences
[DE81-029948] N82-15871
PERFORMANCE PREDICTION
Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247
PERFORMANCE TESTS
Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024
XV-15 Tilt Rotor fly-by-wire collective control demonstrator development specifications
[NASA-CR-166262] N82-15030
Effect of fuel injector type on performance and emissions of reverse-flow combustor
[NASA-TP-1945] N82-15040
Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB81-244071] N82-15354
Steady generation of aerosols with an improved constant output atomizer N82-15398
Performance testing of the Soviet oil/debris skimmer
[PB81-244790] N82-15644
Methods for linking item parameters
[AD-A105509] N82-15779
Using microcomputers to monitor the field performance of residential heat pumps
[PB81-240606] N82-15806
PERIODIC VARIATIONS
Precipitation
[KNMI-117-1981] N82-15683
HF radar measurements of surface currents in the German Bight during MARSEN phase 2
[PB81-244410] N82-15707
PERIPHERAL VISION
Visual problems in aviation and space navigation N82-15758
PERMEABILITY
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519
PEROXIDES
Stereochemistry of reaction involving cyclic peroxides
[AD-A105999] N82-15146
PERSONNEL
Problems in evaluating health effects of occupational and environmental exposures
[DE81-028440] N82-15774
PERTURBATION
Exclusive processes in quantum chromodynamics
[DE81-026233] N82-15151
PETROGRAPHY
The mineralogy of global magnetic anomalies
[E82-10009] N82-15487
PHASE CHANGE MATERIALS
Investigation of medium and high temperature phase change materials for thermal energy storage
[BMFT-FB-T-81-149] N82-15536
PHASE CONTRAST
Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195
PHASE DIAGRAMS
Computer program for computing and plotting Bode, phase, and Nyquist diagrams and time responses of given frequency transfer functions
[LEOK-TR-1979-13] N82-15815
PHASE LOCKED SYSTEMS
Estimation of the parameters of an unmodulated carrier signal disturbed by complex-multiplicative and additive Gaussian noise
[DFVLR-FB-81-23] N82-15291
PHASE SHIFT
Computer program for computing and plotting Bode, phase, and Nyquist diagrams and time responses of given frequency transfer functions
[LEOK-TR-1979-13] N82-15815
Optical Spatial integration methods for ambiguity function generation N82-15906
PHASE TRANSFORMATIONS
Liquid natural gas rapid phase transitions
[PB81-244774] N82-15232
Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461
Small-angle X-ray scattering system with linear position-sensitive detector
[DE81-021920] N82-15967
Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975
Phase transitions and variant actions in lattice gauge theory
[DE81-029324] N82-15977
PHASED ARRAYS
Optical implementation of systolic array processing N82-15899
Infrared fiber optic focal plane dispersers N82-15918
PHENOLIC RESINS
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15206
PHENOLOGY
US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] N82-15494
PHENOLS
Thermolysis of naphthols
[DE81-029684] N82-15152
PHONONS
Illustrative numerical comparisons between phonon mean free paths and phonon thermal conductivity
[DE81-028180] N82-15963
Phonons in graphite intercalation compounds measured by neutron scattering
[DE81-029681] N82-15968
PHOSPHATES
Use of alkali metal-acid phosphates for elevated temperature water electrolysis
[DE81-029607] N82-15156
PHOSPHORUS
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183
PHOTOACOUSTIC SPECTROSCOPY
Photoacoustic detection of particulate carbon
[PB81-245425] N82-15435
PHOTOCATHODES
Ruggedized electronographic tube development
[NASA-CR-166762] N82-15297
PHOTOCHEMICAL REACTIONS
The CHON photochemistry of the troposphere: GRASSLANDS project (summer colloquium 1980)
[PB81-233140] N82-15672
PHOTOCONDUCTORS
Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296
Monolithically integrated active optical devices — with application in optical communication N82-15916
PHOTOELECTRIC EMISSION
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419
The interactions of the HELIOS probe with the solar wind plasma
[BMFT-FB-W-81-036] N82-16036
PHOTOELECTRICITY
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-028386] N82-15209

PHOTOELECTROCHEMICAL DEVICES
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569
PHOTOGRAMMETRY
Empirical-statistical investigations of the accuracy structure of photogrammetric aerial photographs
[SER-C-262] N82-15382
A history of flying and photography: In the Photogrammetry Division of the National Ocean Survey 1919 - 1979
[PB81-246736] N82-15520
Description and comparison of algorithms for solving large sets of sparse matrix normal equations in geodesy and photogrammetry
[SER-C-261] N82-15512
PHOTOINTERPRETATION
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] N82-15486
Visual Evaluation of E-SLAR imagery
[DFVLR-FB-81-11] N82-15503
PHOTOLITHOGRAPHY
Improvements of proximity exposure technique for smaller large-scale integration pattern
[BMFT-FB-T-81-072] N82-15411
Electron optical mask projector with a photocathode for miniaturization
[BMFT-FB-T-81-089] N82-15412
Electron radiation systems for structure production. Part 1: Physical foundations and experimental results
[BMFT-FB-T-81-090-VOL-1] N82-15413
Electron radiation system for structure production. Part 2: Equipment systems and design
[BMFT-FB-T-81-091-VOL-2] N82-15414
Photolithographic processes for small structures: Introduction and trial of electron beam lithography
[BMFT-FB-T-80-199] N82-15430
PHOTOLUMINESCENCE
Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143
PHOTOMASKS
Components for mask technology — in printed circuit production
[BMFT-FB-T-81-055] N82-15351
Electron optical mask projector with a photocathode for miniaturization
[BMFT-FB-T-81-089] N82-15412
Electron radiation systems for structure production. Part 1: Physical foundations and experimental results
[BMFT-FB-T-81-090-VOL-1] N82-15413
Photolithographic processes for small structures: Introduction and trial of electron beam lithography
[BMFT-FB-T-80-199] N82-15430
E-beam generated holographic masks for optical vector-matrix multiplication N82-15919
PHOTON BEAMS
X-ray methods for the chemical characterization of atmospheric aerosols
[DE81-026674] N82-15603
PHOTOOXIDATION
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-238576] N82-15146
PHOTOPRODUCTION
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234
PHOTOTHERMAL CONVERSION
Photothermal spectroscopy of aerosols
[DE81-026096] N82-15150
PHOTOVOLTAIC CELLS
Solar power systems smaller than 500 W for military use
[PML-1980-06] N82-15534
PHOTOVOLTAIC EFFECT
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592
PHYSICAL EXAMINATIONS
Evaluation of crew health N82-15712
PHYSICS
Dimensions, volume 65, number 3
[PB81-236063] N82-15436
PHYSIOCHEMISTRY
Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617
PHYSIOLOGICAL EFFECTS
A compendium of hypokinetic and hypodynamic animal studies
[NASA-CR-3486] N82-15709
Fundamentals of aeronautical and aerospace medical science
[AD-A102298] N82-15736
General laws of aviation and space navigation environmental effects on the human body N82-15739
Human body reaction to vibration N82-15743
Man's adaptation to weightlessness and low weight N82-15746
Noise and sense of hearing N82-15747
The physiological effect of low-air-pressure anoxia N82-15748
Caisson disease N82-15749
Dangers of explosive decompression N82-15750
Oxygen toxication N82-15751
The relationship of body temperature to environmental temperature N82-15752
Comfortable temperature and tolerable temperature N82-15753
The physiological effect of heat and its prevention N82-15754
The effect of cold and the cold prevention N82-15755
Ionizing radiation and its biological effects N82-15756
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775
PHYSIOLOGICAL RESPONSES
The effect of cold and the cold prevention N82-15755
PIEZOELECTRIC CRYSTALS
High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15316
PILOT PERFORMANCE
NASA aviation safety reporting system
[NASA-TM-81274] N82-15025
PILOT PLANTS
Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] N82-15222
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] N82-15530
Moorhead district heating, phase 2
[DE81-029689] N82-15556
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] N82-15633
PILOT SELECTION
Flight illusions N82-15745
PILOT TRAINING
Flight illusions N82-15745
PILOTS (PERSONNEL)
Aviation medical guarantees N82-15761
PIONS
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857
Mid-rapidity pion cross sections: New data confront theories
[DE81-026014] N82-15866
Theory of Coulomb distortion of pion spectra by heavy-ion spectator fragments
[DE81-026013] N82-15867
PIPELINES
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-136] N82-15134
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] N82-15220
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380
PIPES (TUBES)
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029636] N82-15182
Diffusion tube N82-15369
PITOT TUBES
Correlation of transonic-cone Preston-tube data and skin friction — characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019
PLANAR STRUCTURES
Advanced planer silicon test structures
[PB81-229155] N82-15353
PLANE WAVES
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
Plane-wave scattering-matrix theory of antennas and antenna-antenna interactions
[PB81-245243] N82-15356
PLANETARY BOUNDARY LAYER
One and two dimensional modeling of the planetary boundary layer
[MITT-29] N82-15668
PLANKTON
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599
PLANT STRESS
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] N82-15486
PLANTS (BOTANY)
Conference on plant virology N82-15767
PLASMA COMPRESSION
Thermal-fatigue properties of coated materials for fusion-device applications
[DE81-026367] N82-15463
PLASMA CONTROL
Progress toward fusion energy
[UCRL-84974] N82-15888
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
Magnetic Confinement fusion plasma theory
[DE81-029789] N82-15943
PLASMA COOLING
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas — estimate of plasma temperature
[JUEL-1666] N82-15958
PLASMA DIAGNOSTICS
A compilation of Rayleigh cross sections for the laser diagnostics of plasmas — for calibration of Thomson scattering
[IPF-80-10] N82-15959
PLASMA DIFFUSION
LH wave absorption by mode conversion near ion cyclotron harmonics
[DE81-029434] N82-15947
PLASMA EQUILIBRIUM
Equilibrium and stability of experimental high beta toroidal plasmas
[DE81-023610] N82-15944
PLASMA ETCHING
Semiconductor technology for VLSI: Plasma etching and high pressure oxidation
[BMFT-FB-T-81-115] N82-15304
PLASMA FOCUS
Space-resolved measurements of neutrons and ions emitted by a plasma focus
[IPF-80-6] N82-15940
Energy analysis of fast ions from plasma focus discharges
[IPF-80-11] N82-15960
Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15961
PLASMA HEATING
Kinetic theory of Alfven wave heating
[DE81-029777] N82-15582
PLASMA INTERACTIONS
The aerodynamics of bodies in a rarefied ionized gas with applications to spacecraft environmental dynamics
[NASA-TP-1933] N82-15116
PLASMA LAYERS
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas — estimate of plasma temperature
[JUEL-1666] N82-15958

PLASMA PHYSICS
Hyper-filter-fluorescer spectrometer for fusion X-ray diagnostics
[DE81-029867] N82-15425

Survey of atomic physics issues in experimental inertial confinement research
[DE81-028369] N82-15874

PLASMA RADIATION
Kinetic theory of Alfven wave heating
[DE81-029777] N82-15582

PLASMA SPRAYING
Thermodynamics and kinetics of the sulfation of porous calcium silicate
[NASA-TM-82769] N82-15119

Thermal-fatigue properties of coated materials for fusion-device applications
[DE81-028367] N82-15463

PLASMA TEMPERATURE
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas — estimate of plasma temperature
[JUEL-1666] N82-15956

PLASMA WAVES
LH wave absorption by mode conversion near ion cyclotron harmonics
[DE81-029434] N82-15947

PLASMA-ELECTROMAGNETIC INTERACTION
Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946

PLASMAGUIDES
Constance mirror program: Progress and plans
[NASA-CR-164804] N82-15942

PLASMAS (PHYSICS)
The AEROS retarding potential analyzer — for ionospheric plasma parameter determination
[BMFT-FB-W-81-007] N82-15666

Ultra-high-density plasma experiments: MHD simulations
[DE81-030244] N82-15954

Algorithms developed to obtain particular numerical solutions to the ideal MHD equilibrium problem
[DE81-029891] N82-15955

PLASTIC ANISOTROPY
Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455

PLASTIC COATINGS
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] N82-15134

PLASTIC DEFORMATION
Feasibility study of deformation modes of deforming composite materials using visioplasticity method
[NASA-CR-165067] N82-15125

PLASTIC PROPERTIES
Effects of misalignment on mechanical behavior of metals in creep
[NASA-CR-165055] N82-15166

PLASTICS
Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: Material of irradiation
[BMFT-FB-T-81-122-VOL-1] N82-15200

Waste plastic recycling information exchange. Volume 1: Summary report
[PB81-242273] N82-15255

PLATES (STRUCTURAL MEMBERS)
Study of traction rupture strength of graphite-epoxy composite material laminates T300/5208, with and without a central hole
[REPT-137] N82-15138

Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-9] N82-15458

PLETHYSMOGRAPHY
Non-invasive pulmonary arterial pressure measurement
[PB81-239410] N82-15776

PNEUMATIC EQUIPMENT
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] N82-15222

POINT DEFECTS
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15189

POINT SOURCES
On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15694

POISSON RATIO
Indentation law for composite laminates
[NASA-CR-165460] N82-15123

POLAR METEOROLOGY
Environmental satellite imagery, March 1981
[PB81-248049] N82-15698

POLARIZATION (CHARGE SEPARATION)
Non-linear vacuum polarization in strong fields
[DE81-028039] N82-15892

POLARIZATION (WAVES)
Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14839-1] N82-15381

POLARIZATION CHARACTERISTICS
Polarizing multilayer spectrometer for neutrons
[DE81-029546] N82-15876

POLARIZED RADIATION
Low pressure Hugoniot cusp in polymeric materials
[DE81-028267] N82-15204

POLLUTION CONTROL
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433

Sampling and analysis of potential geothermal sites
[PB81-240061] N82-15593

Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607

Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609

Investigations in a laboratory plant for reheating scrubbed flue gases by means of heat exchangers
[BMFT-FB-T-81-005] N82-15615

Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] N82-15623

Evaluation of solvent loss from vapor degreaser systems. Phase 2 and 3: Effect of crosscurrent air velocity on control system performance
[PB81-246308] N82-15625

Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626

Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] N82-15651

Proceedings of a Symposium on Preliminary Results from the September 1979 RESEARCHER/PIERCE IXTOC-1 Cruise
[PB81-246068] N82-15704

Development of an Na distillation process for re-refining waste oil in order to avoid environment pollution. Phase 1: Preliminary tests in Bern
[BMFT-FB-T-81-034] N82-16016

POLLUTION MONITORING
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433

Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] N82-15488

Air quality analysis for the 1984 High Altitude Report to Congress: Summary of results
[PB81-247702] N82-15620

The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627

Air pollution emissions inventory systems. Appendix C: Emissions inventory in the Federal Republic of Germany
[PB81-242232] N82-15631

National performance audit program: 1979 proficiency surveys for sulfur dioxide, nitrogen dioxide, carbon monoxide, sulfate, nitrate, lead and high volume flow
[PB81-239402] N82-15646

Air quality data for nonmetallic inorganic ions: Nitrate and sulfate for 1977 and 1978 from the National Air Surveillance Networks
[PB81-248148] N82-15647

On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15694

POLLUTION TRANSPORT
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] N82-15602

Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610

Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613

Simple methods for the calculation of the dispersion of gases in the atmosphere
[PML-1979-29] N82-15654

POLYCRYSTALS
Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178

Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15589

POLYETHYLENES
Crosslinking of polyethylene in view of an application in wire coating
[BMFT-FB-T-81-058] N82-15211

Characterization of radiation-crosslinked, high-density polyethylene for thermal energy storge applications
[DE81-024915] N82-15549

POLYIMIDES
Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15205

POLYMER MATRIX COMPOSITES
Ion beam surface modification
[NASA-CR-165062] N82-15196

Thermomechanical dynamic analysis of a prepreg: Applications to industrial baking — polymerization and compression of molded materials
[SNIAS-812-551-105] N82-15212

POLYMER PHYSICS
Low pressure Hugoniot cusp in polymeric materials
[DE81-028267] N82-15204

POLYMERIZATION
Characterization of the polymerization of an impregnation resin: Application to industrial baking
[SNIAS-812-551-107] N82-15213

POPULATIONS
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599

POROSITY
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-160(1981)] N82-15469

POROUS MATERIALS
Analysis of column tracer experiments by a stochastic-convective transport method
[DE81-030088] N82-15375

Hydrodynamic and chemical modeling of heavy metals in ash pond leachates
[DE81-028510] N82-15601

PORTABLE EQUIPMENT
Laboratory and field portable system for calibrating airborne multispectral scanners
[DE81-029740] N82-15428

POSITION INDICATORS
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156862] N82-15498

POSITIVE IONS
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973

POSITRONS
Slow positrons in the study of surface and near-surface defects
[DE81-030027] N82-15976

POSTFLIGHT ANALYSIS
Crew medical debriefing N82-15714
POTABLE WATER
Estimate of recharge to the freshwater lens of Northern Guam
[PB81-[illegible]] N82-15519
Development of a simple water pump driven with solar energy
[BMFT-FB-T-81-119] N82-15533
The potable water N82-15725
Space navigation life guarantees N82-15759
POTENTIAL FLOW
On the regularity of the principle value of the double layer potential --- the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828
POTENTIAL THEORY
On the regularity of the principle value of the double layer potential --- the calculation of potential flow around airfoils
[MC-NW-104/81] N82-15828
POWDER (PARTICLES)
The role of the wettability for the production of composite materials in space: Quantities, influences and models
[BMFT-FB-W-81-021] N82-15094
Chemical modification of semiconductor surfaces
[NASA-CR-165066] N82-15140
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] N82-15610
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613
POWER
The integrated optic RF spectrum analyzer
N82-15909
POWER AMPLIFIERS
Improvement of tetrode power amplifier efficiency by adding harmonics to the carrier oscillation and energy savings resulting from volume-dependent Pulse-Duration Modulation (PDM) control
[BMFT-FT-T-81-163] N82-15309
POWER CONDITIONING
High voltage, magnetically switched pulsed power systems
[DE81-026290] N82-15347
POWER EFFICIENCY
On the efficiency of small air coil motors
[WTHD-131] N82-15303
Design of a reluctance motor with increased efficiency and power factor for widespread industrial application
[BMFT-FB-T-81-157] N82-15306
POWER LINES
Improved technique to measure electronically AC losses in superconducting cables
[DE81-028323] N82-15338
PRECIPITATION (CHEMISTRY)
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192
PRECIPITATION (METEOROLOGY)
USSR report: Earth sciences, no. 18
[JPRS-79631] N82-15476
Potential change in climate by year 2000
N82-15478
Climates of past as a model of future climate
N82-15479
An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156863] N82-15678
Network for the measurement of the chemical composition of precipitation in the Netherlands
[KNMI-156-3] N82-15681
Yearbook A Meteorology volume 132
[KNMI-67-132] N82-15682
Precipitation
[KNMI-117-1981] N82-15683
MRI airborne research studies in support of HIPLEX
[PB81-243750] N82-15695
PRECIPITATION PARTICLE MEASUREMENT
Contribution to CCN Workshop report from University of Wyoming group N82-15384
Description and discussion of the NRL TGDCC
N82-15385
The CCN counter of the IOPG of Puy de Dome: Main characteristics and results of measurements
N82-15386
UMR dual mode CCN counter (modes: CFD plus haze) N82-15387
A cloud condensation nucleus spectrometer designed for airborne measurements N82-15388
Static diffusion cloud chambers N82-15389
An airborne isothermal haze chamber N82-15390
A description of the UK Meteorological Office CCN counter N82-15391
Cloud condensation nucleus counter by impactor sampling technique N82-15392
Diffusion tube N82-15393
An automatic light scattering CCN counter
N82-15394
Description of the NRL isothermal haze chamber
N82-15395
Simultaneous operation of three CCN counters and an isothermal haze chamber at the 1980 International CCN Workshop N82-15397
CCN-supersaturation spectra slopes (k)
N82-15400
Measurement of the aerosol size distribution with NRL's mobility analyzer N82-15401
Performance of the continuous flow diffusion chambers N82-15402
Review of isothermal haze chamber performance
N82-15403
Comparing dry aerosol size measurements
N82-15407
Cloud droplet measurement methods: A bibliography
[DFVLR-MITT-81-04] N82-15691
PRECISION
Perspective on precision machining, polishing, and optical requirements
[DE81-028008] N82-15244
PREDICTION ANALYSIS TECHNIQUES
Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans
N82-15058
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339
Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] N82-15605
PREDICTIONS
Prediction techniques N82-15275
Validation of predictive tests and countermeasures for space motion sickness N82-15719
PRELAUNCH SUMMARIES
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107
PREPREGS
Thermomechanical dynamic analysis of a prepreg: Applications to industrial baking --- polymerization and compression of molded materials
[SNIAS-812-551-105] N82-15212
Characterization of the polymerization of an impregnation resin: Application to industrial baking
[SNIAS-812-551-107] N82-15213
PRESIDENTIAL REPORTS
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] N82-16022
PRESSURE DISTRIBUTION
DONBOL: A computer program for predicting axisymmetric nozzle afterbody pressure distributions and drag at subsonic speeds
[NASA-TM-78779] N82-15016
Aerodynamic analysis of cascaded airfoils in unsteady rotational flow --- prediction of flow induced vibrational stress N82-15044
Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation
N82-15045
Pressure-shear loading of materials
[DE81-028250] N82-15462
PRESSURE EFFECTS
Oxygen toxication N82-15751
PRESSURE GAGES
Reaction rates from pressure-gauge measurements in reacting explosives
[DE81-030252] N82-15550
PRESSURE SENSORS
High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15916
Calibration and data correction procedures for flow meters and pressure transducers commonly used by the Coastal Studies Unit
[AD-A105594] N82-15418
PRESSURE SUITS
Man's adaptation to weightlessness and low weight N82-15748
PRESSURIZED CABINS
Oxygen toxication N82-15751
PRINTED CIRCUITS
Components for mask technology --- in printed circuit production
[BMFT-FB-T-81-055] N82-15351
PROBABILITY DISTRIBUTION FUNCTIONS
Statistical description of an attractor
[DE81-027708] N82-15830
Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840
Tabular aids for fitting Weibull moment estimates
[AD-A105965] N82-15842
PROBLEM SOLVING
Development of Integrated Programs for Aerospace-Vehicle Design (IPAD) - IPAD user requirements
[NASA-CR-2985] N82-15034
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826
The composing process in technical communication N82-15991
PROCEEDINGS
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070
PROCESS CONTROL (INDUSTRY)
Characterization of the polymerization of an impregnation resin: Application to industrial baking
[SNIAS-812-551-107] N82-15213
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-166] N82-15252
Study of the structure of a process control system consisting of units for signal processing, operator stations and process computer
[BMFT-FB-T-81-135] N82-15280
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626
PROCESS HEAT
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] N82-15626
PRODUCT DEVELOPMENT
Development of Integrated Programs for Aerospace-Vehicle Design (IPAD) - IPAD user requirements
[NASA-CR-2985] N82-15034
Advanced compressor components. Phase 1: 1976 to 1979 --- for aircraft engines
[BMFT-FB-W-81-025] N82-15073
Testing results of MF-Nbsub3Sn
[DE81-026632] N82-15135
Development of cryorefrigerators
[BMFT-FB-T-81-107] N82-15236
Development of force-cooled superconductors for use in large magnets
[DE81-026067] N82-15343
Components for mask technology --- in printed circuit production
[BMFT-FB-T-81-055] N82-15351
Development of a process camera lens with variable focal length
[BMFT-FB-T-81-155] N82-15415

Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535
High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] N82-15536
Microcomputer large-scale integration chips
[BMFT-FB-T-81-068] N82-15792
Development on a new kind of microprocessor-based lock
[BMFT-FB-T-81-128] N82-15794

PRODUCTION ENGINEERING
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Production engineering
[BMFT-FB-T-81-124-VOL-3] N82-15202
Development of a process for an inexpensive production of thin film solar cells on an industrial scale
[BMFT-FB-T-81-159] N82-15539
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] N82-15553

PRODUCTION MANAGEMENT
Minicomputer and computer numerical control maintenance
[DE81-030645] N82-15800

PROFILE METHOD (FORECASTING)
Review and update of modeling analysis of carbon monoxide emissions in Mecklenburg County, North Carolina
[PB81-248641] N82-15639

PROGRAM VERIFICATION (COMPUTERS)
Status report on DOE-sponsored meteorological model validation program
[DP-MS-81-20] N82-15669
DECSYSTEM-20, model 2060, COBOL-74, version 12B
[PB81-233983] N82-15803
DECSYSTEM-10, model 1090-SMP COBOL-74, version 12B
[PB81-233975] N82-15804
Northern Telecom, Inc., COBOL/3. Indexed I-O module
[PB81-233991] N82-15805
Basic four information systems division (MAI)/S80 COBOL version 1.00 indexed I-O module
[PB81-248114] N82-15807
International Business Machines, Inc., System/34 COBOL, 5726-CB1 Release 7 with PTF 07096
[PB81-249088] N82-15808
International Business Machines, Inc., System/38 COBOL, 5714-CB1 Release 2
[PB81-249104] N82-15809
International Business Machines, Inc., 5714-CB1 Release 2, Indexed I-O module
[PB81-249112] N82-15810
International Business Machines, Inc., 5726-CB1 Release 7 with PTF-07096, Indexed I-O module
[PB81-249120] N82-15811
Integrated testing and verification system for research flight software design document
[NASA-CR-159095] N82-15813
Proceedings of Software Verification and Validation Symposium
[PB81-236465] N82-15823
Preliminary internal data screening: A component of quantitative data analysis in data validation
[CONF-810842-1] N82-16005

PROJECT MANAGEMENT
The Airbus program: quality policy
[SNIAS-812-551-101] N82-15009
Aeronomy satellites AEROS A and B: The assistance to the project by the project scientist
[BMFT-FB-W-81-029] N82-15109
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165068] N82-15115
Study and development of high strength composite material structures by the Thermomechanical Department of the Space Division of Matra
N82-15127
Practical demonstration of urban air quality simulation models. Part 1: A report of the NATO/CCMS pilot study on air pollution assessment methodology and modeling
[PB81-242240] N82-15630

PROJECT PLANNING
Research outlook, 1981 — toxic hazard research and control
[PB81-243495] N82-15640
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] N82-16014

PROJECTILES
Stability measuring and dispersion of shells with different lengths of low aerodynamic drag tip
[FOA-C-20418-D2] N82-15022
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111
Electromagnetic launcher: A new weapon
[DE81-029979] N82-15287

PROJECTORS
Electron radiation systems for structure production. Part 1: Physical foundations and experimental results
[BMFT-FB-T-81-090-VOL-1] N82-15413

PROPELLANT GRAINS
Tracer investigations of the laws governing the migration of phlegmatizers in gun propellants
[BMVG-FBWT-81-7] N82-15215

PROPELLANT STORAGE
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117

PROPELLANT TANKS
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117

PROPELLANT TRANSFER
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117

PROPELLER FANS
Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15378

PROPULSION SYSTEM PERFORMANCE
Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019

PROTECTIVE CLOTHING
Human body reaction to vibration N82-15743
Evaluation of chemical protective facelets and comparison of four prototpyes
[IZF-1980-15] N82-15784

PROTECTIVE COATINGS
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] N82-15134
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569

PROTEINS
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735
All-Union Conference on New Sources of Food Protein and Their Application N82-15765

PROTON SCATTERING
Intermediate energy proton and light-ion scattering
[DE81-030115] N82-15878

PROTOTYPES
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532
Specifications of Sandia prototype network communications interface between applications software and NSC A120 adapters
[DE81-028451] N82-15824

PROVING
Basic four information systems division (MAI)/S80 COBOL version 1.00 indexed I-O module
[PB81-248114] N82-15807
International Business Machines, Inc., System/34 COBOL, 5726-CB1 Release 7 with PTF 07096
[PB81-249088] N82-15808
International Business Machines, Inc., System/38 COBOL, 5714-CB1 Release 2
[PB81-249104] N82-15809
International Business Machines, Inc., 5714-CB1 Release 2, Indexed I-O module
[PB81-249112] N82-15810
International Business Machines, Inc., 5726-CB1 Release 7 with PTF-07096, Indexed I-O module
[PB81-249120] N82-15811

PROXIMITY EFFECT (ELECTRICITY)
Improvements of proximity exposure technique for smaller large-scale integration pattern
[BMFT-FB-T-81-072] N82-15411

PSYCHOACOUSTICS
Results of the Third International Congress on Noise Effects: As a public health problem; biological disturbances; effects on behavior
[BMFT-FB-HA-81-013] N82-15597

PSYCHOLOGICAL FACTORS
The composing process in technical communications N82-15993

PUBLIC RELATIONS
Index to NASA News Releases and Speeches, 1980 N82-15985

PULMONARY CIRCULATION
Non-invasive pulmonary arterial pressure measurement
[PB81-239410] N82-15776

PULSE CODE MODULATION
An MS43 block code having an error multiplication smaller than that of the MMS43 code and a reduced portion of the power density spectrum near the frequency zero
[FTZ-FI-044-TBR-88] N82-15266

PULSE COMMUNICATION
An MS43 block code having an error multiplication smaller than that of the MMS43 code and a reduced portion of the power density spectrum near the frequency zero
[FTZ-FI-044-TBR-88] N82-15266
Cost functions of the long-term planning of digital transmission systems using coaxial cables
[FTZ-FI-03-TBR-14] N82-15267
System concepts and basic technologies for receiver components of digital radio link systems at 20 GHz
[BMFT-FB-T-81-166] N82-15281

PULSE DURATION MODULATION
Improvement of tetrode power amplifier efficiency by adding harmonics to the carrier oscillation and energy savings resulting from volume-dependent Pulse-Duration Modulation (PDM) control
[BMFT-FT-T-81-163] N82-15309

PULSE RATE
Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15268

PULSED LASERS
Optical analysis and alignment applications using the infrared Smartt interferometer
[DE81-030257] N82-15937

PULSED RADIATION
Pulsed-irradiation creep in nickel
[DE81-030078] N82-15187
Effect of cyclic pulsed temperature on void growth in metals during irradiation
[DE81-030112] N82-15188

PUMPS
Development of a simple water pump driven with solar energy
[BMFT-FB-T-81-119] N82-15533

PURITY
The mass spectra and isotopic purity of compounds proposed for use in the master analytical scheme for the analysis of organic compounds in water
[PB81-238453] N82-15163

PYRITES
The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15962

PYROLYSIS
Recovery of raw materials by pyrolysis
[BMFT-FB-T-81-017] N82-15141

PYROLYTIC GRAPHITE
Phonons in graphite intercalation compounds measured by neutron scattering
[DE81-029681] N82-15866

Q

Q FACTORS
Design of a reluctance motor with increased efficiency and power factor for widespread industrial application
[BMFT-FB-T-81-157] N82-15308

High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15316

Development of a computerized measuring system for quantitative digital image analysis Interactive Image Analysis System (IBAS)
[BMFT-FB-T-81-036] N82-15820

QUALITY CONTROL

The Airbus program: quality policy
[SNIAS-812-551-101] N82-15009

Study of high quality composite materials at Limours, France N82-15129

Quality control of composites: Activities and instituted means
[N-25,856/R.E.Q.C.] N82-15130

National performance audit program: 1979 proficiency surveys for sulfur dioxide, nitrogen dioxide, carbon monoxide, sulfate, nitrate, lead and high volume flow
[PB81-239402] N82-15646

Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926

QUANTITATIVE ANALYSIS

Vaporization and chemical transport under coal gasification conditions
[PB81-245839] N82-15165

Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195

QUANTUM CHROMODYNAMICS

Exclusive processes in quantum chromodynamics
[DE81-028233] N82-15151

Polynomial chromodynamics
[DE81-028036] N82-15890

Phase transitions and variant actions in lattice gauge theory
[DE81-029324] N82-15977

QUANTUM EFFICIENCY

Spectral response measurements for solar cells
[DE81-030097] N82-15568

QUANTUM ELECTRODYNAMICS

Parameterization of the bremsstrahlung spectrum
[DE81-029739] N82-15859

QUARKS

Quarkonium spectroscopy
[DE81-028229] N82-15159

QUARTZ

Shock-compression measurements at pressures greater than 1 TPa
[DE81-030113] N82-15372

QUARTZ CRYSTALS

Optimizing development of a bipolar stepping motor with electronic circuit for quartz analogue clocks
[BMFT-FB-T-81-077] N82-15299

Pressure-shear loading of materials
[DE81-028250] N82-15462

QUARTZ TRANSDUCERS

High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15316

R

RACKS (FRAMES)

Feasibility study (phase A) for a Life Science Double Rack envisaged for the Spacelab mission D1
[BMFT-FB-W-81-037] N82-15732

RADAR ANTENNAS

Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] N82-15500

RADAR CORNER REFLECTORS

Evaporated As2S3 Luneburg lenses for LiNbO3:Ti optical waveguides N82-15914

RADAR DETECTION

Improvement of radar target searches by a range dependent detection threshold or signal amplification
[FFM-301] N82-15265

RADAR IMAGERY

Visual Evaluation of E-SLAR imagery
[DFVLR-FB-81-11] N82-15503

RADAR MAPS

HF radar measurements of surface currents in the German Bight during MARSEN phase 2
[PB81-244410] N82-15707

RADAR TARGETS

Improvement of radar target searches by a range dependent detection threshold or signal amplification
[FFM-301] N82-15265

RADIANT FLUX DENSITY

The effect of fire retardants on the heat-release rate of building materials
[PB81-236487] N82-15259

RADIATION ABSORPTION

A model for calculating the absorbed dose to populations taking local weather statistics into consideration — after nuclear reactor accidents
[FOA-C-40140-A3] N82-15692

RADIATION COUNTERS

Photothermal spectroscopy of aerosols
[DE81-028098] N82-15150

RADIATION DAMAGE

Precipitation and cavity formation in austenitic stainless steels during irradiation
[DE81-028062] N82-15174

Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15189

Ionizing radiation and its biological effects N82-15756

Stress dependence of creep in Ni bombarded with 17-MeV deuterons
[DE81-030080] N82-15869

RADIATION DETECTORS

Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296

A two dimensional position sensitive deltaE-E counter for energetic light charged particles N82-15882

High resolution X-ray imager
[BMFT-FB-W-81-042] N82-15928

Small-angle X-ray scattering system with linear position-sensitive detector
[DE81-021920] N82-15967

Gamma ray detector for Solar Maximum Mission (SMM) of NASA
[BMFT-FB-W-81-020] N82-16035

RADIATION DOSAGE

A model for calculating the absorbed dose to populations taking local weather statistics into consideration — after nuclear reactor accidents
[FOA-C-40140-A3] N82-15692

STS-1 medical report
[NASA-TM-58240] N82-15711

Radiological health N82-15727

Ionizing radiation and its biological effects N82-15756

Problems in evaluating health effects of occupational and environmental exposures
[DE81-028440] N82-15774

RADIATION EFFECTS

Notch tensile behavior of irradiated 20 percent cold-worked Type 316 stainless steel
[DE81-028170] N82-15181

Effect of cyclic pulsed temperature on void growth in metals during irradiation
[DE81-030112] N82-15188

Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192

Solid state microelectronics tolerant to radiation and high temperature — JFET thick film hybrids N82-15331

Ionizing radiation and its biological effects N82-15756

Other biological effects of radiation N82-15757

RADIATION HAZARDS

Problems in evaluating health effects of occupational and environmental exposures
[DE81-028440] N82-15774

RADIATION MEASUREMENT

Alpha-spectroscopic techniques for field measurement of radon daughters
[DE81-029846] N82-15158

Radiation characteristics of cloud fields — transmission, reflection, emission
[MITT-30] N82-15669

Problems in evaluating health effects of occupational and environmental exposures
[DE81-028440] N82-15774

RADIATION MEASURING INSTRUMENTS

Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] N82-15673

Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773

RADIATION MEDICINE

Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772

RADIATION PROTECTION

Other biological effects of radiation N82-15757

RADIATION SHIELDING

Ionizing radiation and its biological effects N82-15756

RADIATION SOURCES

Radiation characteristics of cloud fields — transmission, reflection, emission
[MITT-30] N82-15669

RADIATION SPECTRA

Terrestrial solar spectral modeling
[DE81-029067] N82-15664

RADIATION TOLERANCE

Mechanical strength of low-temperature-irradiated polyimides: A five-to-tenfold improvement in dose resistance over epoxies
[DE81-025469] N82-15205

Solid state microelectronics tolerant to radiation and high temperature — JFET thick film hybrids N82-15331

RADIATION TRANSPORT

Possible applications of the steering of charged particles by bent single crystals
[DE81-028601] N82-15966

RADIATIVE HEAT TRANSFER

Influence of precursor heating on viscous flow around a Jovian entry body
[NASA-CR-3174] N82-15361

Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366

Development and adaptation of conduction and radiation heat-transfer computer codes for the CFTL
[DE81-028033] N82-15369

RADIATIVE LIFETIME

Depopulation rates for combustion-related species in long-lived vibrationally or electronically excited levels
[DE81-030042] N82-15968

RADIATIVE TRANSFER

Radiation characteristics of cloud fields — transmission, reflection, emission
[MITT-30] N82-15669

Earth-feature identification for onboard multispectral data editing: Computational experiments N82-15896

RADIO ASTRONOMY

Bulk and integrated acousto-optic spectrometers for radio astronomy N82-15902

RADIO BEACONS

Packaging techniques for low-altitude Venus balloons beacon N82-15338

RADIO EQUIPMENT

Integrated circuits for TV and radio applications
[BMFT-FB-T-81-068] N82-15279

RADIO FREQUENCIES

A broadband RF continuously variable time delay device --- using Bragg cell and optical heterodyne technology for signal processing N82-15915

Lower hybrid rf heating experiments in the MIT Alcator A, C and Versator II Tokamaks
[DE81-028193] N82-15941

RADIO FREQUENCY HEATING

Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946

RADIO INTERFEROMETERS

Analysis of Meteorological Satellite location and data collection system concepts
[NASA-CR-166763] N82-15679

RADIO RECEIVERS

System concepts and basic technologies for receiver components of digital radio link systems at 20 GHz
[BMFT-FB-T-81-166] N82-15281

RADIO RELAY SYSTEMS

A 16 QAM modem for a 140 Mbit/sec radio relay system
[FTZ-FI-21-TBR-20] N82-15269

RADIO WAVES

Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946

RADIOACTIVE DECAY

Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877

RADIOACTIVE WASTES
Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891
RADIOACTIVITY
Results of calculations of external gamma-radiation exposure rates from fallout and the related radionuclide compositions. Operation Ranger, 1951
[DE81-030487] N82-15872
RADIOLOGY
Remote Medical Diagnosis System (RMDS) utilization study
[AD-A105559] N82-15771
RADON ISOTOPES
Alpha-spectroscopic techniques for field measurement of radon daughters
[DE81-029846] N82-15158
RAIL TRANSPORTATION
Transit planning and management
[PB81-238032] N82-16017
RAIN
Characteristics of rain and rain systems
N82-15271
An overview of several rain and attenuation models N82-15272
Depolarization on Earth-space paths N82-15273
Study of the influence of precipitations and clouds on the performance of synthetic aperture radars
[ESA-CR(P)-1465] N82-15290
RAINDROPS
MRI airborne research studies in support of HIPLEX
[PB81-243750] N82-15695
RAMAN SPECTRA
Raman-scattering gas temperature measurements in particle-laden flows
[DE81-029621] N82-15370
RANDOM LOADS
Estimation methods for the determination of dynamic responses of elastic aircraft --- to random loads
[BMVG-FBWT-81-6] N82-15037
RANDOM NOISE
Information capacity of Gaussian channels
[AD-A105659] N82-15283
Estimation of the parameters of an unmodulated carrier signal disturbed by complex-multiplicative and additive Gaussian noise
[DFVLR-FB-81-23] N82-15291
RANGEFINDING
Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] N82-15500
New baseline system N82-15501
Squinted SAR system N82-15502
RANK TESTS
Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841
RANKINE CYCLE
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] N82-15537
Overview of active solar absorption/Rankine cooling program
[DE81-028041] N82-15577
RANKING
Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840
RARE EARTH ELEMENTS
Precise trace rare Earth analysis by radiochemical neutron activation
[DE81-030009] N82-15153
Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557
RAREFIED GAS DYNAMICS
The aerodynamics of bodies in a rarefied ionized gas with applications to spacecraft environmental dynamics
[NASA-TP-1933] N82-15116
RAY TRACING
Use of Zernike polynomials and interferometry in the optical design and assembly of large carbon-dioxide laser systems
[DE81-030138] N82-15443
Automatic calculation of spheroelliptical systems, essential facts, and elementary traces (cassette): Utilization
[LAS-OPT.INST-02-81] N82-15822
RAYLEIGH SCATTERING
Estimation of the parameters of an unmodulated carrier signal disturbed by complex-multiplicative and additive Gaussian noise
[DFVLR-FB-81-23] N82-15291
A compilation of Rayleigh cross sections for the laser diagnostics of plasmas --- for calibration of Thomson scattering
[IPF-80-10] N82-15959
RCA SATCOM C
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107
REACTION
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
REACTION KINETICS
Thermodynamics and kinetics of the sulfation of porous calcium silicate
[NASA-TM-82769] N82-15119
Investigation by means of laser magnetic resonance of the OH/HO2 reaction yielding H2O/O2
[MPIS-18A/1980] N82-15161
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
Reaction rates from pressure-gauge measurements in reacting explosives
[DE81-030252] N82-15230
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607
Reaction parameters for heavy-ion collisions
N82-15883
Effects of reagent translational and vibrational energy on the dynamics of endothermic reactions
[DE81-028122] N82-15969
REACTION PRODUCTS
Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product --- ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142
REACTIVITY
Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891
REACTOR CORES
Wireless, in-vessel neutron monitor for initial core-loading of advanced breeder reactors
N82-15330
Development and adaptation of conduction and radiation heat-transfer computer codes for the CFTL
[DE81-028033] N82-15369
REACTOR MATERIALS
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177
Pulsed-irradiation creep in nickel
[DE81-030078] N82-15187
Swelling of several commercial alloys following high fluence neutron irradiation
[DE81-029604] N82-15191
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
REACTOR SAFETY
Comparison of computer codes (CE-THERM, FRAP-T5, GT3-FLECHT, and TRUMP-FLECHT) with data from the NRU-LOCA thermal hydraulic tests
[DE81-028136] N82-15817
READERS
Teaching audience analysis to the technical student N82-15995
READOUT
Design and performance of the new cathode readout proportional chambers in LASS
[DE81-028097] N82-15422
REAL TIME OPERATION
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604
High speed techniques for synthetic aperture radar image formation N82-15898
Microchannel spatial light modulator N82-15917
RECHARGING
Evaluation program for secondary spacecraft cells: Seventeenth annual report of cycle life test
[NASA-CR-165071] N82-15526
Energy storage systems for terrestrial solar generators --- cadmium/mercury oxide cells
[BMFT-FB-T-81-082] N82-15529
RECLAMATION
Salvage of a USAF F-106 Delta Dart
[AD-A105810] N82-15240
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10016] N82-15496
RECOMBINATION REACTIONS
Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143
RECORDS
OSTA data systems planning workshop recommendations N82-15098
Federal records management: A history of neglect
[PB81-237133] N82-15963
RECOVERY
Development of the ARIES parachute system
[NASA-TM-84082] N82-15023
RECRYSTALLIZATION
Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826
RECURSIVE FUNCTIONS
On martingales and recursive optimal state estimation
[NLR-TR-80056-U] N82-15838
RECYCLING
Recovery of raw materials by pyrolysis
[BMFT-FB-T-81-017] N82-15141
Recycling plant for paint sludges
[BMFT-FB-T-81-125] N82-15203
Waste plastic recycling information exchange. Volume 1: Summary report
[PB81-242273] N82-15255
REDOX CELLS
Chemically modified electrodes for electrocatalysis
[AD-A105563] N82-15147
REDUCTION (CHEMISTRY)
Mechanistic studies of carbon monoxide reduction
[DE81-030063] N82-15157
Thermochemical production of liquids from biomass
[DE81-030085] N82-15226
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607
REEFS
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706
REFINING
The conversion of agricultural by-products to sugars
[PB81-241432] N82-15588
REFLECTANCE
Continuing development of the DEROB system --- calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243
REFRACTIVITY
Development of optical plastics
[BMFT-FB-T-81-121] N82-15927
REFRACTORY MATERIALS
NBS: Materials measurements
[NASA-CR-165076] N82-15121
Reliability study of refractory gate gallium arsenide MESFETS N82-15324
REFRACTORY METAL ALLOYS
Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195
REFRACTORY METALS
Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557
REFRIGERATING MACHINERY
Cycle design for the ISABELLE helium refrigerator
[DE81-030551] N82-15249
Analysis of cooldown performance for ISABELLE helium refrigerator
[DE81-030548] N82-15250

REFRIGERATORS
Development of cryorefrigerators
[BMFT-FB-T-81-107] N82-15236
REGENERATORS
Development of cryorefrigerators
[BMFT-FB-T-81-107] N82-15236
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-089] N82-15067
REGIONAL PLANNING
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] N82-15589
REGULATIONS
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15836
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15852
REINFORCED PLATES
Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473
RELATIVISTIC PARTICLES
Mid-rapidity pion cross sections: New data confront theories
[DE81-028014] N82-15866
RELAXATION METHOD (MATHEMATICS)
Surrogate duality relaxation for job shop scheduling
[MC-BW-145/81] N82-15835
RELIABILITY ANALYSIS
Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339
Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340
RELUCTANCE
Design of a reluctance motor with increased efficiency and power factor for widespread industrial application
[BMFT-FB-T-81-157] N82-15306
REMOTE SENSING
Civil land remote sensing systems
[GPO-35-265] N82-15497
Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] N82-15504
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] N82-15873
Satellite observed planetary albedo and its parameterization
[PB81-236874] N82-15888
REMOTELY PILOTED VEHICLES
Survey of the observer's performance with remotely piloted vehicles — on target recognition
[BMVG-FBWT-81-3] N82-15036
REMOVAL
Separation of hydrogen isotopes via single column pressure-swing adsorption
[DE81-015858] N82-15149
Disequilibrium of hydrogen sulfide in ground water by aeration
[PB81-244717] N82-15828
REPORTS
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070
Activities and Accounts report --- water science research N82-15475
REQUIREMENTS
On-site meteorological instrumentation requirements to characterize diffusion from point sources: Workshop report
[PB81-247223] N82-15894
RESEARCH
Research programme 1981/82 — water science N82-15474
Activities and Accounts report --- water science research N82-15475
RESEARCH AND DEVELOPMENT
Groupe Matra Composites Conference — conference proceedings, Velizy, France, 24 Apr. 1981 N82-15126
Study of high quality composite materials at Limours, France N82-15129
The influence of aeronautical R&D expenditures upon the productivity of air transportation
[PB81-247140] N82-15884
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] N82-16022
RESEARCH FACILITIES
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079
Dimensions, volume 65, number 3
[PB81-236063] N82-15436
RESEARCH MANAGEMENT
Research outlook, 1981 — toxic hazard research and control
[PB81-243495] N82-15640
Research in urban planning during the 70's --- Netherlands
[TNO-80/PS/206] N82-16015
RESERVOIRS
Reservoir stability studies
[DE81-030099] N82-15510
RESIDENTIAL AREAS
Practical demonstration of urban air quality simulation models. Part 1: A report of the NATO/CCMS pilot study on air pollution assessment methodology and modeling
[PB81-242240] N82-15630
RESIDENTIAL ENERGY
Mobile infiltration test unit: its design and capabilities, preliminary experimental results
[DE81-031927] N82-15245
The Mit Abu El Kom Solar demonstration project in Egypt. Phase A: Solar thermal installations
[BMFT-FB-T-81-164] N82-15540
Technology change and energy consumption: A comparison of residential subdivisions
[DE81-030075] N82-15555
Incremental cooling load determination for passive direct gain heating systems
[DE81-029682] N82-15575
Assessment methodology for the air quality impact of residential wood burning
[DE81-026373] N82-15606
Proceedings of the conference on wood combustion environmental assessment
[PB81-248155] N82-15622
RESIN MATRIX COMPOSITES
Applications of composites in missiles and missile launchers N82-15128
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15208
RESINS
Groupe Matra Composites Conference — conference proceedings, Velizy, France, 24 Apr. 1981 N82-15126
RESISTANCE HEATING
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] N82-15168
RESISTORS
Passive components for high temperature operation N82-15314
RESOLUTION
Instrument for liquids, amorphous and power diffraction
[DE81-030135] N82-15421
RESONANCE FLUORESCENCE
Depopulation rates for combustion-related species in long-lived vibrationally or electronically excited levels
[DE81-030042] N82-15968
RESONANCE SCATTERING
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772
Illustrative numerical comparisons between phonon mean free paths and phonon thermal conductivity
[DE81-026180] N82-15863
RESONANCE TESTING
Using the envelope of resonance peaks to estimate power absorbed by a finite structure — vibration
[ISVR-TR-115] N82-15472
RESONANT VIBRATION
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-166057] N82-15092
Aspects of acoustic resonance phenomena in turbomachines N82-15069
RESONATORS
High-temperature measurements of Q-factor in rotated X-cut quartz resonators N82-15316
RESOURCE ALLOCATION
Role of large scale energy systems models in R&D planning
[DE81-026058] N82-15543
RESOURCES MANAGEMENT
Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482
RESPONSES
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433
RETROFITTING
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544
Passive-solar retrofit study for the United States Navy
[DE81-030250] N82-15574
RHEOLOGY
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] N82-15509
RIBONUCLEIC ACIDS
Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735
RIGID STRUCTURES
Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-9] N82-15458
RING STRUCTURES
Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455
RIVER BASINS
Water resources data for Idaho, water year 1980. Volume 1: Great Basin and Snake River Basin above King Hill
[PB81-244186] N82-15517
RIVERS
Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] N82-15486
Water resources data for Idaho, water year 1980. Volume 1: Great Basin and Snake River Basin above King Hill
[PB81-244186] N82-15517
ROBOTS
Humanization of working places in the foundry by use of an automatic fettling equipment
[BMFT-FB-HA-81-004] N82-15781
ROCK MECHANICS
System analysis of alternative procedures for deep drilling technique for depth between 6,000 and 10,000 meters
[BMFT-FB-T-81-067] N82-15237
Sandia program in geothermal technology development
[DE81-025394] N82-15545
ROCKET ENGINE DESIGN
Electrothermal hydrazine thruster
[BAE-RPT/EHT/40212-VOL-1] N82-15118
ROCKET LAUNCHING
Development of the ARIES parachute system
[NASA-TM-84082] N82-15023
ROCKET LININGS
Accelerated aging of HTPB-based composite propellants and liners
[FOA-C-20405-D1] N82-15216
ROCKET SOUNDING
Auroral spectrometer AF6 for the POLAR HIGH ATMOSPHERE rocket campaign
[BMFT-FB-W-81-008] N82-15885

Sounding rocket program AERONOMY project: 'Polar High Atmosphere' mass spectrometer experiment — magnetic storm activity
[BMFT-FB-W-81-027] N82-15671

ROCKS

Hot dry rock geothermal prospects, 1981
[DE81-025305] N82-15559

ROCKY MOUNTAINS (NORTH AMERICA)

Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587

RODS

Characteristics for calculating parts made of reinforced plastics
[NASA-TM-75915] N82-15455

ROLL

Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

ROLL FORMING

Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-168] N82-15252

Technical and scientific research accompanying the projects on 'Needle Milling', including the determination of specific process parameters
[BMFT-FB-HA-81-005] N82-15447

ROOMS

Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248

ROOTS OF EQUATIONS

Projected Markov parameters and multivariable root-loci
[RR-146] N82-15639

ROTARY WINGS

Flag-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013

Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165057] N82-15032

ROTATING BODIES

Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] N82-15367

ROTATING SHAFTS

System analysis of alternative procedures for deep drilling technique for depth between 6,000 and 10,000 meters
[BMFT-FB-T-81-067] N82-15237

ROTOR AERODYNAMICS

Aeroelasticity in turbomachines --- conference proceedings
[EPFL-ITA-10] N82-15042

Calculation of hydrodynamic interaction of the arbitrary profile cascades in the flow of ideal liquid N82-15043

Aerodynamic analysis of cascaded airfoils in unsteady rotational flow — prediction of flow induced vibrational stress N82-15044

Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation N82-15045

Force and moment coefficients for high deflection cascades — theory behind a computer program N82-15046

Aerodynamic response of a blade in pitching oscillation with partial and full separation — measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel N82-15047

Damping for turbomachine blade variations in subsonic flow N82-15048

Self excited flow oscillation in the low pressure steam turbine cascade N82-15049

Calculation of quasi-stationary aerodynamic forbe acting on a cascade of oscillating airfoils in subsonic flow N82-15051

Computer aided investigation of turbomachine aerodynamics and aeroelasticity N82-15053

On the numerical analysis of stall flutter in turbine cascades N82-15054

Control of vibration in aeroelastic cascade experiments N82-15056

Effect of mean blade loading on supersonic cascade flutter N82-15059

A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects N82-15060

Calculation of nonstationary force ratios on blades of a rotating row in incompressible flow N82-15061

Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062

ROTOR BLADES (TURBOMACHINERY)

Inlet distortion and blade vibration in compressible flow between parallel walls N82-15066

ROWLAND CIRCLES

Auroral spectrometer AF6 for the POLAR HIGH ATMOSPHERE rocket campaign
[BMFT-FB-W-81-006] N82-15665

RUGGEDNESS

Ruggedized electronographic tube development
[NASA-CR-166762] N82-15297

RUN TIME (COMPUTERS)

Theoretical basis of the DOE-2 building energy use analysis program
[DE81-026896] N82-15242

Computing time measurements on the FFM multicomputer system --- Communications and Mathematics Research Institute (FFM)
[FFM-300] N82-15790

RUNWAY CONDITIONS

Automated Pilot Advisory System
[NASA-TM-73296] N82-15027

S

S MATRIX THEORY

Plane-wave scattering-matrix theory of antennas and antenna-antenna interactions
[PB81-245243] N82-15358

S WAVES

Dynamic shear-wave velocity measurements using interferometric techniques
[DE81-026973] N82-15467

SAFETY DEVICES

Highway safety appurtenances
[PB81-236065] N82-16021

SAFETY MANAGEMENT

Inexact inference for rule-based damage assessment of exising structures
[PB81-235913] N82-15261

Development of tests and criteria to evaluate grounding systems
[PB81-238354] N82-15522

SALINITY

Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

SALT BEDS

Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

Analytical and numerical model experiments concerning the physics of rock salt formation
[GAMMA-38] N82-15979

SALYUT SPACE STATION

USSR Space Life Sciences Digest
[NASA-TM-84080] N82-15708

SAMARIUM ISOTOPES

Integral-capture measurements and cross-section adjustments for Nd, Sm, and Eu
[DE81-029635] N82-15970

SATELLITE CONFIGURATIONS

ROBISAT: Concept and feasibility study, phase A
[BMFT-FB-W-80-033] N82-15108

The Atlas-C mission
[DFVLR-FB-81-19] N82-15113

SATELLITE OBSERVATION

Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] N82-15499

Environmental satellite imagery, March 1981
[PB81-248049] N82-15698

SATELLITE ORBITS

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] N82-15483

LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495

SATELLITE TELEVISION

Meteorological satellites
[AD-A107427] N82-15110

SATELLITE TRANSMISSION

Propagation effects handbook for satellite systems design: A summary of propagation impairments on 10 to 100 GHz satellite links with techniques for system design
[NASA-RP-1082] N82-15270

Depolarization on Earth-space paths N82-15273

Propagation data bases N82-15274

Prediction techniques N82-15275

Application of propagation predictions to Earth/space telecommunications system design N82-15276

SATELLITE-BORNE INSTRUMENTS

ROBISAT: Concept and feasibility study, phase A
[BMFT-FB-W-80-033] N82-15108

SATELLITE-BORNE PHOTOGRAPHY

The Atlas-C mission
[DFVLR-FB-81-19] N82-15113

Environmental satellite imagery, March 1981
[PB81-248049] N82-15698

SATURN (PLANET)

Voyager 1 encounters Saturn
[NASA-TM-84078] N82-16030

SCALE

Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024

SCANNERS

Advanced Microwave Moisture Sounder (AMMS) for WB-57F CCOPE mission
[NASA-CR-166752] N82-15408

SCATTERING

Dynamics of hadron-nucleus interactions
[DE81-026272] N82-15856

SCATTERING COEFFICIENTS

Complexity of short period P seismograms: What does scattering contribute?
[AWRE-O-3/81] N82-15853

SCATTERING CROSS SECTIONS

Study of structure of nuclei with neutrons and nuclear data measurements for MFE
[DE81-028388] N82-15854

Potential determination of the system sodium (3 2P) plus mercury (6 1S) by measuring and analyzing the rainbow scattering in the superthermal energy domain between 0.3 and 3.2eV
[MPIS-23/1980] N82-15887

A compilation of Rayleigh cross sections for the laser diagnostics of plasmas — for calibration of Thomson scattering
[IPF-80-10] N82-15959

Effects of reagent translational and vibrational energy on the dynamics of endothermic reactions
[DE81-026122] N82-15969

SCENE ANALYSIS

Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482

The optical recognition of surface targets as a function of surrounding, target and observation parameters in air to surface observations
[BMVG-FBWT-81-8] N82-15929

SCHEDULING

Analysis of heuristics for stochastic programming: Results for hierarchical scheduling problems
[MC-BUT-142/81] N82-15816

Surrogate duality relaxation for job shop scheduling
[MC-BW-145/81] N82-15835

SCHMIDT CAMERAS

Theoretical study of image spots with the wide field camera and the implications for nebular spectrography --- computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15939

SCHOTTKY DIODES

Derivative measurement system for current-voltage and light-current-voltage characteristics --- of double-heterostructure lasers
[FTZ-FI-512-TBR-6] N82-15293

SCINTILLATION

Myocardial perfusion scintigraphy using a new technique, the mesh chamber
[DE81-027995] N82-15773

SCRAMBLING (COMMUNICATION)

Identifier protection in a distributed operating system
[DE81-025978] N82-15844

SCRAP
Waste plastic recycling information exchange. Volume 1: Summary report
[PB81-242273] N82-15255
SCRUBBERS
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demonstration test second year results
[PB81-246016] N82-15626
SEA STATES
Global ocean tides. Part 7: The diurnal principal solar tide (P1), atlas of tidal charts and maps
[AD-A106812] N82-15700
SEA TRUTH
Laser depth sounding in the Baltic Sea — from airplanes
[FOA-C-30219-E1] N82-15702
SEA WATER
Photoproduction of hydrogen by marine blue-green algae
[PB81-241424] N82-15234
Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701
SEALING
Aeronautical applications of bonding
[SNIAS-812-551-102] N82-15010
SEARCH PROFILES
Depth/breadth tradoff in hierarchical computer menus
[DE81-028392] N82-15799
A Workshop on Qualitative Information Retrieval
[AD-A106687] N82-16000
SEARCH RADAR
Improvement of radar target searches by a range dependent detection threshold or signal amplification
[FFM-301] N82-15265
SEARCHING
Salvage of a USAF F-106 Delta Dart
[AD-A106610] N82-15240
SECURITY
Identifier protection in a distributed operating system
[DE81-025978] N82-15844
SEDIMENT TRANSPORT
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705
SEISMIC WAVES
An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15660
SEISMOGRAMS
Complexity of short period P seismograms: What does scattering contribute?
[AWRE-O-3/81] N82-15653
SEISMOGRAPHS
An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15660
SEISMOLOGY
Probabilistic analysis for liquefaction
[PB81-249724] N82-15263
SELECTIVE DISSEMINATION OF INFORMATION
Air Pollution Pilot Study: Assessment methodology and modeling, 1975 - 1979 (first follow-up report)
[PB81-242257] N82-15629
National Hurricane operations plan
[PB81-247231] N82-15697
SEMICONDUCTING FILMS
Reliability study of refractory gate gallium arsenide MESFETS N82-15324
In-situ electron microscope fracture studies of amorphous films
[DE81-028141] N82-15971
SEMICONDUCTOR DEVICES
Chemical modification of semiconductor surfaces
[NASA-CR-165066] N82-15140
Proceedings of the Conference on High-temperature Electronics
[NASA-TM-84069] N82-15311
High temperature electronic requirements in aeropropulsion systems
[E-706] N82-15313
Amorphous metallizations for high-temperature semiconductor device applications N82-15316
Electron irradiation of semiconductor devices
[BMFT-FB-T-81-045] N82-15350
The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15982
SEMICONDUCTOR DIODES
Production and use of high-grade silicon-diode temperature sensors
[DE81-030547] N82-15424
Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535
SEMICONDUCTOR LASERS
Derivative measurement system for current-voltage and light-current-voltage characteristics — of double-heterostructure lasers
[FTZ-FI-512-TBR-6] N82-15293
Optical pumped neodymium miniature laser transmitter
[BMFT-FB-T-81-095] N82-15437
Laser diode
[BMFT-FB-T-81-151] N82-15439
SEMICONDUCTORS (MATERIALS)
Microanalysis by electron-spinning spectrometer for material and process control in semiconductor technology
[BMFT-FB-T-80-193] N82-15160
Investigation of semiconductor clad optical waveguides
[NASA-CR-165074] N82-15278
Electrical switching in cadmium boracite single crystals N82-15325
Whatever happened to silicon carbide — semiconductor devices N82-15326
Some considerations regarding film thickness standards for the semiconductor industry
[PB81-239535] N82-15357
Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965
SENSITIVITY
Response factors of VOC analyzers at a meter reading of 10,000 ppmv for selected organic compounds
[PB81-234817] N82-15433
SENTENCES
Using sentence combining in technical writing classes N82-15994
SEPARATED FLOW
Computation of subsonic flow around airfoil systems with multiple separation
[DFVLR-FB-81-24] N82-15021
Aerodynamic response of a blade in pitching oscillation with partial and full separation — measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel N82-15047
SERVICE LIFE
Interfacial structures in nickel-based transition joints after long term service
[DE81-903971] N82-15155
SERVOCONTROL
Development of a measuring, control, and regulation unit for a cylinder turning machine
[BMFT-FB-T-81-106] N82-15450
SERVOMOTORS
On the efficiency of small air coil motors
[WTHD-131] N82-15303
SEWAGE
Ultraviolet disinfection of a secondary wastewater treatment plant effluent
[PB81-242125] N82-15646
SEWAGE TREATMENT
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] N82-15633
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236481] N82-15645
SHADES
Description of an exact recursive method to simplify shading calculations
[DE81-027409] N82-15818
SHALLOW WATER
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706
SHAPE MEMORY ALLOYS
Effects of tensile deformation on the strain memory behavior of uranium-niobium alpha double prime martensite
[DE81-030295] N82-15184
SHAPES
Experimental investigation of the influence of the casing geometry upon the flow conditions and the noise of a centrifugal fan
[DFVLR-FB-81-20] N82-15376
SHEAR FLOW
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062
SHEAR PROPERTIES
User's guide: Computer Program for Three-dimensional Analysis of Building Systems (CTABS80)
[AD-A105513] N82-15241
SHEAR STRESS
Pressure-shear loading of materials
[DE81-028250] N82-15462
SHELL STABILITY
Stability measuring and dispersion of shells with different lengths of low aerodynamic drag tip
[FOA-C-20418-D2] N82-15022
SHOCK HEATING
Global kinetics for the shock-induced decomposition of heterogeneous explosives
[DE81-025252] N82-15229
SHOCK LAYERS
Influence of precursor heating on viscous flow around a Jovian entry body
[NASA-CR-3174] N82-15361
SHOCK TUBES
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365
SHOCK WAVE PROFILES
Time-resolved wave profile measurements in copper to Megabar pressures
[DE81-026109] N82-15373
SHOCK WAVES
Low pressure Hugoniot cusp in polymeric materials
[DE81-028267] N82-15204
Acta mechanica sinica (selected articles)
[AD-A106123] N82-15362
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845
SHOPS
Surrogate duality relaxation for job shop scheduling
[MC-BW-145/81] N82-15835
SHORELINES
Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-238962] N82-15632
SIALON
Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231086] N82-15214
SIGNAL ANALYSIS
Estimation of the parameters of an unmodulated carrier signal disturbed by complex-multiplicative and additive Gaussian noise
[DFVLR-FB-81-23] N82-15291
SIGNAL DETECTION
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850
SIGNAL DETECTORS
The integrated optic RF spectrum analyzer
N82-15909
SIGNAL MEASUREMENT
Characterization of GaAs superhigh frequency field effect power transistors in the nonlinear mode
[ENST-E-81001] N82-15352
SIGNAL PROCESSING
Study of the structure of a process control system consisting of units for signal processing, operator stations and process computer
[BMFT-FB-T-81-135] N82-15280
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter — turbomachinery applications
[MITT-79-04] N82-15429
Interferometric surface-wave acousto-optic time-integrating correlators N82-15905

Applications of electro-optic gratings in integrated optical signal processing devices N82-15910

A broadband RF continuously variable time delay device — using Bragg cell and optical heterodyne technology for signal processing N82-15915

SIGNAL RECEPTION

Faraday rotation measurement method and apparatus
[NASA-CASE-NPO-14839-1] N82-15381

SIGNAL TO NOISE RATIOS

The signal to noise ratio of a heterodyne laser detection system
[PHL-1980-11] N82-15438

SIGNAL TRANSMISSION

Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15288

SIGNATURE ANALYSIS

An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15860

SILANES

Chemical modification of TiO2 surfaces with methylsilanes and characterization by infrared absorption spectroscopy
[NASA-CR-165063] N82-15139

SILICON

Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143

Nitridation of silicon
[NASA-TM-82722] N82-15197

Electrical screening of integrated circuits by semi-insulating silicon layers
[BMFT-FB-T-81-134] N82-15305

High temperature LSI N82-15332

High-temperature Complementary Metal Oxide Semiconductors (CMOS)
[SAND-81-0345C] N82-15333

Production and use of high-grade silicon-diode temperature sensors
[DE81-030547] N82-15424

Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-028143] N82-15974

SILICON CARBIDES

Whatever happened to silicon carbide — semiconductor devices N82-15326

SILICON DIOXIDE

Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15066

Topography of the electrical properties of the silicon/oxide interface and the influence of technologic treatments
[BMFT-FB-T-81-066] N82-15301

Four- and five-layer silicon-clad dielectric waveguides N82-15911

SILICON JUNCTIONS

Advanced planar silicon test structures
[PB81-229155] N82-15353

SILICON NITRIDES

Nitridation of silicon
[NASA-TM-82722] N82-15197

Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231086] N82-15214

SILICONE RESINS

Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15208

SILVER

Determination of diffusion coefficients of anions at a rotating silver disc electrode
[AD-A105828] N82-15310

SIMILARITY THEOREM

Design, performance, and similarity laws of subsonic parachutes
[BMVG-FBWT-81-4] N82-15024

SIMULATION

Steady-state heat transfer to boiling liquid helium in simulated coil windings
[DE81-028561] N82-15371

Evaluation of infrared simulation data
[AD-A105872] N82-15931

SINGLE CRYSTALS

Preparation of Spacelab experiments on Si, CdTe, and ZnS crystal growth during the E1 and D1 missions and construction and testing of a single ellipsoid mirror heating facility
[BMFT-FB-W-81-023] N82-15092

Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154

Electrical switching in cadmium boracite single crystals N82-15325

Possible applications of the steering of charged particles by bent single crystals
[DE81-028601] N82-15966

Slow positrons in the study of surface and near-surface defects
[DE81-030027] N82-15976

SINTERING

Nitridation of silicon
[NASA-TM-82722] N82-15197

Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231086] N82-15214

SITE SELECTION

Hot dry rock geothermal prospects, 1981
[DE81-025305] N82-15559

Environmental programs for Ocean Thermal Energy Conversion (OTEC)
[DE81-028876] N82-15570

Geologic hazards and their relation to planning, location, and design of transportation facilities
[PB81-235467] N82-16020

SITES

GRAD: A tool for program analysis and progress monitoring
[DE81-028098] N82-15981

SKIN (STRUCTURAL MEMBER)

Application of skin technology: TEXUS 2 experiment
[BMFT-FB-W-81-028] N82-15067

SKIN FRICTION

Correlation of transonic-cone Preston-tube data and skin friction — characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019

SKY BRIGHTNESS

Continuing development of the DEROB system — calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243

SLENDER WINGS

A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031

SLIDING FRICTION

Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198

SLIP CASTING

Investigation on the applicability of slip casting for the production of cermets under microgravity conditions
[BMFT-FB-W-81-017] N82-15091

SLUDGE

Recycling plant for paint sludges
[BMFT-FB-T-81-125] N82-15203

SLURRIES

Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221

SMOKE

The use of Lidar for emissions source opacity determinations: Second edition
[PB81-246662] N82-15627

SNOW COVER

Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] N82-15673

SOCIAL FACTORS

Community noise assessment manual: Social survey workbook
[PB81-244360] N82-15635

SODIUM CHLORIDES

Estimate of recharge to the freshwater lens of Northern Guam
[PB81-233595] N82-15519

Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] N82-15556

SODIUM SULFUR BATTERIES

A presently available energy supply for high temperature environment (550-1000 deg F)
N82-15334

SOFTENING

Slip systems and solid solution softening/hardening in BCC metals
[DE81-026883] N82-15179

SOIL MOISTURE

Quantitative analysis of drainage obtained from aerial photographs and RBV/LANDSAT images
[E82-10008] N82-15486

SOILS

Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264

Elements for the numerical analysis of wave motion in layered media
[PB81-245268] N82-15292

SOLAR ARRAYS

Solar power systems smaller than 500 W for military use
[PML-1980-06] N82-15534

SOLAR CELLS

Process development for large-scale production of CdS thin film solar cells Sputtered copper sulfide layers and cadmium sulfide-copper sulfide heteorojunctions. Application of high rate sputtering using hot-pressed targets
[BMFT-FB-T-81-069] N82-15528

Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535

Development of a process for an inexpensive production of thin film solar cells on an industrial scale
[BMFT-FB-T-81-159] N82-15539

Spectral response measurements for solar cells
[DE81-030097] N82-15568

Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569

Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029683] N82-15578

SOLAR COLLECTORS

Dimensions, volume 65, number 3
[PB81-235053] N82-15436

High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] N82-15538

Low-cost mirror concentrator based on inflated, double-walled, metalized, tubular films
[DE81-027813] N82-15551

Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] N82-15572

SOLAR CONSTANT

Earth feature identification for onboard multispectral data editing: Computational experiments
N82-15696

SOLAR COOLING

Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247

Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544

Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] N82-15572

Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029683] N82-15578

Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592

SOLAR ENERGY

Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247

Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248

Development of a simple water pump driven with solar energy
[BMFT-FB-T-81-119] N82-15533

High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] N82-15539
Comparison of concepts for solar-heated or solar-driven absorption and compression cooling machines for air conditioning and food preservation purposes, phase 1
[BMFT-FB-T-81-166] N82-15541
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544
Industrial process heat applications for solar thermal technologies
[DE81-025934] N82-15545
Solar energy training program for code enforcement personnel
[DE81-030053] N82-15563
Evaluation of the passive solar for agriculture program
[DE81-030056] N82-15565
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] N82-15571
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576
Development of a modular heat exchanger with integrated latent heat energy store — for solar heating applications
[BMFT-FB-T-81-050] N82-15584
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613

SOLAR ENERGY ABSORBERS
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] N82-15551
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] N82-15579

SOLAR ENERGY CONVERSION
Advanced solar energy conversion — solar pumped gas lasers
[NASA-CR-165060] N82-15526
Solar power systems smaller than 500 W for military use
[PML-1980-06] N82-15534
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] N82-15537
Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] N82-15572
Overview of active solar absorption/Rankine cooling program
[DE81-028041] N82-15577

SOLAR FLARES
Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246688] N82-16037

SOLAR GENERATORS
Energy storage systems for terrestrial solar generators — cadmium/mercury oxide cells
[BMFT-FB-T-81-062] N82-15529
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] N82-15530
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532
Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] N82-15572

SOLAR HEATING
Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247
Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248
The Mit Abu El Kom Solar demonstration project in Egypt. Phase A: Solar thermal installations
[BMFT-FB-T-81-164] N82-15540
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544
Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] N82-15572
Passive-solar retrofit study for the United States Navy
[DE81-030250] N82-15574
Incremental cooling load determination for passive direct gain heating systems
[DE81-029862] N82-15575
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029863] N82-15578
Development of a modular heat exchanger with integrated latent heat energy store — for solar heating applications
[BMFT-FB-T-81-050] N82-15584
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] N82-15592

SOLAR HOUSES
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] N82-15544
Summary of passive solar multi-family design workshops
[DE81-030353] N82-15564
Evaluation of the passive solar for agriculture program
[DE81-030056] N82-15565

SOLAR MAGNETIC FIELD
Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246688] N82-16037

SOLAR MAXIMUM MISSION
Gamma ray detector for Solar Maximum Mission (SMM) of NASA
[BMFT-FB-W-81-020] N82-16035

SOLAR POWER SATELLITES
Satellite Power System: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238] N82-15524

SOLAR PROTONS
Solar-geophysical data number 441, May 1981. Part 2 (Comprehensive reports). Data for November 1980
[PB81-246696] N82-16038

SOLAR RADIATION
Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair
[DE81-030235] N82-15581
Terrestrial solar spectral modeling
[DE81-029067] N82-15664
Radiation characteristics of cloud fields — transmission, reflection, emission
[MITT-30] N82-15669
Use of environmental satellite data for input to energy balance snowmelt models
[PB81-227795] N82-15673
Solar radiation measurement project
[NASA-CR-165064] N82-16033

SOLAR RADIO EMISSION
Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246688] N82-16037
Solar-geophysical data number 441, May 1981. Part 2 (Comprehensive reports). Data for November 1980
[PB81-246696] N82-16038

SOLAR SYSTEM
A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039

SOLAR THERMAL PROPULSION
Industrial process heat applications for solar thermal technologies
[DE81-025934] N82-15545

SOLAR WIND
The instruments of the plasma experiment onboard the HELIOS solar probe
[BMFT-FB-W-81-015] N82-16034
The interactions of the HELIOS probe with the solar wind plasma
[BMFT-FB-W-81-036] N82-16036

SOLAR WIND VELOCITY
Solar-geophysical data number 441, May 1981. Part 1 (Prompt reports). Data for April 1981, March 1981
[PB81-246688] N82-16037

SOLAR X-RAYS
Solar-geophysical data number 441, May 1981. Part 2 (Comprehensive reports). Data for November 1980
[PB81-246696] N82-16038

SOLID ELECTROLYTES
A presently available energy supply for high temperature environment (550-1000 deg F)
N82-15334

SOLID ROCKET PROPELLANTS
Development of a solid propellant with a high level fuel content for Volvo rocket engine AB(VFA)
[FOA-C-20421-D3] N82-15217

SOLID SOLUTIONS
Slip systems and solid solution softening/hardening in BCC metals
[DE81-028663] N82-15179

SOLID STATE DEVICES
Gamma ray detector for Solar Maximum Mission (SMM) of NASA
[BMFT-FB-W-81-020] N82-16035

SOLID STATE LASERS
Aberrations and focusability in large solid-state-laser systems
[DE81-029914] N82-15442

SOLID SUSPENSIONS
Laboratory demonstration of the feasibility of using commercially-available, in-depth filters for suspended solids removal by cross-flow filtration
[PB81-243719] N82-15649

SOLID WASTES
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636

SOLIDS
Recent advances in the study of structural phase transistors at high pressure
[DE81-030206] N82-15975

SOLUBILITY
Internal convection under low gravity due to orthogonal gradients of temperature and concentration
[BMFT-FB-W-81-041] N82-15089

SOLUTES
Analysis of column tracer experiments by a stochastic-convective transport method
[DE81-030088] N82-15375
Hydrodynamic and chemical modeling of heavy metals in ash pond leachates
[DE81-026510] N82-15601

SOLVENT EXTRACTION
High-pressure solvent extraction of methane from geopressured fluids
[DE81-027713] N82-15227

SOLVENTS
Tracer investigations of the laws governing the migration of phlegmatizers in gun propellants
[BMVG-FBWT-81-7] N82-15215
Evaluation of solvent loss from vapor degreaser systems. Phase 2 and 3: Effect of crosscurrent air velocity on control system performance
[PB81-246308] N82-15625

SONIC BOOMS
Environmental effects of shuttle launch and landing N82-15729

SORPTION
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177

SOUND INTENSITY
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848

SOUND PRESSURE
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848

SOUND PROPAGATION
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775
Application of steady state finite element and transient finite difference theory to sound propagation in a variable area duct: A comparison with experiment
[NASA-TM-82678] N82-15847

SOUND TRANSMISSION
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15846
Sound damping in a condensation loaded gas flow
[MPIS-24/1980] N82-15852
SOUND WAVES
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775
SOUNDING
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15656
Laser depth sounding in the Baltic Sea — from airplanes
[FOA-C-30219-E1] N82-15702
SOUTH AMERICA
Archaeoastronomy in the Americas — conference
[BP-AP-22] N82-16023
SOUTH DAKOTA
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481
SOVIET SPACECRAFT
Meteorological satellites
[AD-A107427] N82-15110
SPACE COOLING (BUILDINGS)
Heating and cooling applications of atriums and attached greenhouses: A state-of-the-art report
[DE81-022161] N82-15573
Description of an exact recursive method to simplify shading calculations
[DE81-027409] N82-15818
SPACE EXPLORATION
High temperature electronics applications in space exploration N82-15312
SPACE FLIGHT FEEDING
STS-1 medical report
[NASA-TM-58240] N82-15711
Food and nutrition N82-15724
The potable water N82-15725
Space navigation life quarantees N82-15759
SPACE FLIGHT STRESS
A compendium of hypokinetic and hypodynamic animal studies
[NASA-CR-3466] N82-15709
SPACE HEATING (BUILDINGS)
Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248
Feasibility analysis of geothermal district heating for Lakeview, Oregon
[DOE/ET-27229/T1] N82-15547
Moorhead district heating, phase 2
[DE81-029669] N82-15556
Summary of passive solar multi-family design workshops
[DE81-030353] N82-15564
Heating and cooling applications of atriums and attached greenhouses: A state-of-the-art report
[DE81-022161] N82-15573
Passive-solar retrofit study for the United States Navy
[DE81-030250] N82-15574
Incremental cooling load determination for passive direct gain heating systems
[DE81-029662] N82-15575
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029683] N82-15578
Development of a modular heat exchanger with integrated latent heat energy store — for solar heating applications
[BMFT-FB-T-81-050] N82-15584
Description of an exact recursive method to simplify shading calculations
[DE81-027409] N82-15818
SPACE MANUFACTURING
Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093
SPACE MISSIONS
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] N82-16022
Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031
SPACE PERCEPTION
Visual problems in aviation and space navigation
N82-15758
SPACE PROCESSING
Application of skin technology: TEXUS 2 experiment
[BMFT-FB-W-81-026] N82-15087
Preparation of Spacelab experiments on Si, CdTe, and ZnS crystal growth during the E1 and D1 missions and construction and testing of a single ellipsoid mirror heating facility
[BMFT-FB-W-81-023] N82-15092
The role of the wettability for the production of composite materials in space: Quantities, influences and models
[BMFT-FB-W-81-021] N82-15094
SPACE SHUTTLE ORBITERS
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117
Shuttle toxicology N82-15726
SPACE SHUTTLE PAYLOADS
ROBISAT: Concept and feasibility study, phase A
[BMFT-FB-W-80-033] N82-15108
The Atlas-C mission
[DFVLR-FB-81-19] N82-15113
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165066] N82-15115
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117
Concept study of a life sciences payload element (PLE) for the SL-D1 mission
[BMFT-FB-W-81-038] N82-15733
SPACE SHUTTLES
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165066] N82-15115
SPACE SUITS
Space navigation life quarantees N82-15759
SPACE TRANSPORTATION SYSTEM
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165066] N82-15115
Satellite Power System: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238] N82-15524
SPACE TRANSPORTATION SYSTEM 1 FLIGHT
STS-1 medical report
[NASA-TM-58240] N82-15711
Evaluation of crew health N82-15712
Inflight observations N82-15713
Crew medical debriefing N82-15714
Health stabilization program N82-15715
Emergency Medical Services System (EMSS)
N82-15716
Crew medical training N82-15717
Shuttle orbital medical system N82-15718
Validation of predictive tests and countermeasures for space motion sickness N82-15719
Crew cardiovascular profile N82-15720
Biochemistry and endocrinology results
N82-15721
Hematological and immunological analyses
N82-15722
Medical microbiology of crewmembers
N82-15723
Food and nutrition N82-15724
The potable water N82-15725
Shuttle toxicology N82-15726
Radiological health N82-15727
Cabin acoustical noise N82-15728
Environmental effects of shuttle launch and landing N82-15729
Medical information management N82-15730
Management, planning, and implementation of medical operations N82-15731
SPACE VEHICLE CHECKOUT PROGRAM
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165066] N82-15115
SPACEBORNE EXPERIMENTS
Feasibility study: Atmospheric general circulation experiment, volume 2
[NASA-CR-161868-VOL-2] N82-15086
Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117
Feasibility study (phase A) for a Life Science Double Rack envisaged for the Spacelab mission D1
[BMFT-FB-W-81-037] N82-15732
Concept study of a life sciences payload element (PLE) for the SL-D1 mission
[BMFT-FB-W-81-038] N82-15733
Energetic particles flux experiment for ISEE mother/daughter spacecraft
[NASA-CR-166761] N82-16028
SPACEBORNE PHOTOGRAPHY
Viking lander imaging investigation during extended and continuation automatic missions. Volume 2: Lander 2 picture catalog of experiment data record
[NASA-RP-1068-VOL-2] N82-16029
Voyager 1 encounters Saturn
[NASA-TM-84078] N82-16030
SPACEBORNE TELESCOPES
Three Mirror Anastigmatic (TMA) telescope for observation of faint objects in the ultraviolet (1200 to 1800 A) applied in the GLASAR experiment — mirror optimization N82-16025
SPACECRAFT CABIN ATMOSPHERES
STS-1 medical report
[NASA-TM-58240] N82-15711
Medical microbiology of crewmembers
N82-15723
Shuttle toxicology N82-15726
Cabin pollution N82-15760
Preprototype nitrogen supply subsystem development
[NASA-CR-166192] N82-15780
SPACECRAFT CABINS
Cabin acoustical noise N82-15728
Dangers of explosive decompression N82-15750
SPACECRAFT CHARGING
The aerodynamics of bodies in a rarefied ionized gas with applications to spacecraft environmental dynamics
[NASA-TP-1933] N82-15116
The interactions of the HELIOS probe with the solar wind plasma
[BMFT-FB-W-81-036] N82-16036
SPACECRAFT COMMUNICATION
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114
SPACECRAFT CONFIGURATIONS
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107
SPACECRAFT CONTAMINATION
Shuttle toxicology N82-15726
SPACECRAFT ELECTRONIC EQUIPMENT
High temperature electronics applications in space exploration N82-15312
SPACECRAFT ENVIRONMENTS
Environmental conditions of aviation and space navigation N82-15738
The relationship of body temperature to environmental temperature N82-15752
Space navigation life quarantees N82-15759
SPACECRAFT LAUNCHING
Mission Operation Report: RCA-C1/Delta launch
[NASA-TM-84087] N82-15107
Environmental effects of shuttle launch and landing N82-15729
SPACECRAFT PERFORMANCE
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 April to 23 July 1979
[E82-10005] N82-15483
LANDSAT-2 and LANDSAT-3 flight evaluation report, 23 October 1978 to 23 January 1979
[E82-10017] N82-15495
SPACECRAFT POSITION INDICATORS
Analysis of Meteorological Satellite location and data collection system concepts
[NASA-CR-166763] N82-15679
SPACECRAFT POWER SUPPLIES
Evaluation program for secondary spacecraft cells: Seventeenth annual report of cycle life test
[NASA-CR-165071] N82-15525

SPACECRAFT RECOVERY

Development of the ARIES parachute system
[NASA-TM-84082] N82-15023

SPACECRAFT TRACKING

Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114

SPACECREWS

STS-1 medical report
[NASA-TM-58240] N82-15711
Evaluation of crew health N82-15712
Inflight observations N82-15713
Crew medical debriefing N82-15714
Health stabilization program N82-15715
Crew medical training N82-15717
Validation of predictive tests and countermeasures for space motion sickness N82-15719
Crew cardiovascular profile N82-15720
Biochemistry and endocrinology results N82-15721
Hematological and immunological analyses N82-15722
Medical microbiology of crewmembers N82-15723
Radiological health N82-15727

SPACELAB

Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093
Theoretical study of image spots with the wide field camera and the implications for nebular spectrography — computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15939

SPACELAB PAYLOADS

Preparation of Spacelab experiments on Si, CdTe, and ZnS crystal growth during the E1 and D1 missions and construction and testing of a single ellipsoid mirror heating facility
[BMFT-FB-W-81-023] N82-15092
Cryogenic fluid management experiment
[NASA-CR-165495] N82-15117
Feasibility study (phase A) for a Life Science Double Rack envisaged for the Spacelab mission D1
[BMFT-FB-W-81-037] N82-15732
Concept study of a life sciences payload element (PLE) for the SL-D1 mission
[BMFT-FB-W-81-036] N82-15733

SPATIAL DEPENDENCIES

Continuing development of the DEROB system — calculating indoor illumination levels for the dynamic energy response of buildings program
[DE81-027971] N82-15243

SPATIAL RESOLUTION

Infrared fiber optic focal plane dispersers N82-15916
Fine-grained hodoscopes based on scintillating optical fibers
[DE81-029316] N82-15935

SPECIFICATIONS

The role of pilots N82-15097
Specifications of Sandia prototype network communications interface between applications software and NSC A120 adapters
[DE81-028451] N82-15824

SPECKLE PATTERNS

Investigation of a coherent optical method for roughness measurements
[BMFT-FB-T-81-065] N82-15923

SPECTRAL EMISSION

Theory of Coulomb distortion of pion spectra by heavy-ion spectator fragments
[DE81-028013] N82-15867

SPECTRAL ENERGY DISTRIBUTION

Spectral response measurements for solar cells
[DE81-030097] N82-15568
Parameterization of the bremsstrahlung spectrum
[DE81-029739] N82-15859

SPECTRAL REFLECTANCE

Earth feature identification for onboard multispectral data editing: Computational experiments N82-15896

SPECTRAL SENSITIVITY

Spectral response measurements for solar cells
[DE81-030097] N82-15568

SPECTRAL SIGNATURES

Earth feature identification for onboard multispectral data editing: Computational experiments N82-15896

SPECTROGRAPHS

Ruggedized electronographic tube development
[NASA-CR-166782] N82-15297

SPECTROMETERS

Precise trace rare Earth analysis by radiochemical neutron activation
[DE81-030009] N82-15153
A cloud condensation nucleus spectrometer designed for airborne measurements N82-15386
Data evaluation and data processing of the low-energy particle spectrometer E8 on board the HELIOS probes
[BMFT-FB-W-81-035] N82-15418
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419
Design and performance of the new cathode readout proportional chambers in LASS
[DE81-028097] N82-15422
Multiparticle magnetic spectrometer with dE/dx and TRD particle identification
[DE81-030567] N82-15423
Hyper-filter-fluorescer spectrometer for fusion X-ray diagnostics
[DE81-029867] N82-15425
Data processing and data evaluation of the ISEE-particle spectrometer
[BMFT-FB-W-81-032] N82-15858
Spectroscopic observations of comets
[NASA-CR-165077] N82-16029

SPECTROPHOTOMETRY

Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735

SPECTROSCOPIC ANALYSIS

Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734
Spectrophotometric studies of the RNA structure in E.coli ribosomes. Part 2: Influence of ions and proteins on the RNA secondary structure
[ISS-R-80/3-PT-2] N82-15735

SPECTROSCOPY

Alpha-spectroscopic techniques for field measurement of radon daughters
[DE81-029646] N82-15158
Quarkonium spectroscopy
[DE81-028229] N82-15159

SPECTRUM ANALYSIS

The integrated optic RF spectrum analyzer N82-15909

SPEED INDICATORS

Correlation of transonic-cone Preston-tube data and skin friction --- characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019

SPENT FUELS

Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891

SPHERICAL SHELLS

Localized loads applied to shells of revolution
[KFK-CAD-155] N82-15470

SPILLING

Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596
Threé-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] N82-15602

SPIN STABILIZATION

ROBISAT: Concept and feasibility study, phase A
[BMFT-FB-W-80-033] N82-15106

SPLINE FUNCTIONS

An algorithm which determines the global least squares equidistant spline fit
[NLR-TR-80008-U] N82-15837

SPRAYED COATINGS

An evaluation of engineering control technology for spray painting
[PB81-243123] N82-15769

SPRAYING

Recycling plant for paint sludges
[BMFT-FB-T-81-125] N82-15203

SPUTTERING

Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176
Ion beam surface modification
[NASA-CR-165082] N82-15186
Process development for large-scale production of CdS thin film solar cells Sputtered copper sulfide layers and cadmium sulfide-copper sulfide heterojunctions. Application of high rate sputtering using hot-pressed targets
[BMFT-FB-T-81-069] N82-15528

STABILITY

Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15208

STABILITY AUGMENTATION

Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

STABILITY DERIVATIVES

Stability measuring and dispersion of shells with different lengths of low aerodynamic drag tip
[FOA-C-20418-D2] N82-15022
Stability and flutter analysis of turbine blades at low speed N82-15050
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

STABLE OSCILLATIONS

Introduction to the calculation of parametrically excited oscillations
[ISBN-3-7983-5150-3] N82-15294

STAINLESS STEELS

High-temperature fatigue life of type 316 stainless steel containing irradiation induced helium
[DE81-028679] N82-15170
Swelling, microstructural development and helium effects in type 316 stainless steel irradiated in HFIR and EBR-II
[DE81-028603] N82-15171
Corrosion of type 316 stainless steel in molten LiF-LiCl-LiBr
[DE81-028633] N82-15172
Corrosion of high-temperature materials in AFBC environments. Part 2: 4500-h tests
[DE81-028024] N82-15173
Notch tensile behavior of irradiated 20 percent cold-worked Type 316 stainless steel
[DE81-028170] N82-15181
Effects of transmutation products on swelling in 316 stainless steel
[DE81-029805] N82-15190
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15196
On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-83] N82-15448

STANDARDIZATION

Practical demonstration of urban air quality simulation models. Part 1: A report of the NATO/CCMS pilot study on air pollution assessment methodology and modeling
[PB81-242240] N82-15630
Construction and use of a standard source for far infrared astronomy experiments
[MPI-PAE/EXTRATERR-165] N82-16024

STANDARDS

Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards
[NASA-CP-2196] N82-15095
OSTA/ADS standards development process N82-15096
ADS pilot methodologies as candidates for ADS standards N82-15100
Panel A report: Standards needed to interconnect ADS pilots for data sharing for catalogues, directories, and dictionaries N82-15101
Panel B report: Standards needed to interconnect ADS pilots for data sharing for user interfaces N82-15102
Panel C report: Standards needed for the use of ISO Open Systems Interconnection - basic reference model N82-15103

Panel D report: Standards needed to interconnect ADS pilots for data sharing in data formats and descriptions N82-15104

Some considerations regarding film thickness standards for the semiconductor industry
[PB81-239535] N82-15357

Solar energy training program for code enforcement personnel
[DE81-030053] N82-15563

Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] N82-15621

Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636

DECSYSTEM-20, model 2060, COBOL-74, version 12B
[PB81-233963] N82-15803

DECSYSTEM-10, model 1090-SMP COBOL-74, version 12B
[PB81-233975] N82-15804

Basic four information systems division (MAI)/S80 COBOL version 1.00 indexed I-O module
[PB81-248114] N82-15807

International Business Machines, Inc., System/34 COBOL, 5726-CB1 Release 7 with PTF 07096
[PB81-249088] N82-15808

International Business Machines, Inc., System/38 COBOL, 5714-CB1 Release 2
[PB81-249104] N82-15809

International Business Machines, Inc., 5714-CB1 Release 2, Indexed I-O module
[PB81-249112] N82-15810

International Business Machines, Inc., 5726-CB1 Release 7 with PTF-07096, Indexed I-O module
[PB81-249120] N82-15811

Technical communication. Perspectives for the Eighties, part 2
[NASA-CP-2203-PT-2] N82-15986

STATIC LOADS

Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473

STATIC PRESSURE

Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report)
[NASA-CR-165806] N82-15014

STATISTICAL ANALYSIS

Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339

Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340

Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677

STATISTICAL MECHANICS

Response of reinforced concrete plate-column connections to dynamic and static horizontal loads
[PB81-237380] N82-15473

STDN (NETWORK)

Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114

STEADY FLOW

Unsteady pressure distributions in a cascade taking into account profile thickness and steady circulation N82-15045

STEADY STATE

Nonlinear steady-state coupling of LH waves
[DE81-029435] N82-15946

STEAM TURBINES

Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines N82-15193

Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] N82-15561

STEEL STRUCTURES

Detection of flaws in reinforcing steel in prestressed concrete bridge members
[PB81-241630] N82-15258

Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-008] N82-15851

STEELS

Advantages and limitations in the use of diverse materials for aircraft construction — composite versus metallic materials
[SNIAS-811-551-104] N82-15011

Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457

STELLAR EVOLUTION

Supernova hydrodynamics
[DE81-030243] N82-16027

STELLAR MASS EJECTION

Supernova hydrodynamics
[DE81-030243] N82-16027

STELLAR MODELS

Supernova hydrodynamics
[DE81-030243] N82-16027

STEPPING MOTORS

Optimizing development of a bipolar stepping motor with electronic circuit for quartz analogue clocks
[BMFT-FB-T-81-077] N82-15299

STEREOCHEMISTRY

Stereochemistry of reaction involving cyclic peroxides
[AD-A105999] N82-15146

STIFFNESS

Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-9] N82-15458

STOCHASTIC PROCESSES

Empirical-statistical investigations of the accuracy structure of photogrammetric aerial photographs
[SER-C-262] N82-15382

Analysis of heuristics for stochastic programming: Results for hierarchical scheduling problems
[MC-BUT-142/81] N82-15816

Statistical description of an attractor
[DE81-027708] N82-15830

Properties of stochastic labeling procedures --- optimization model
[FOA-C-30229-E1] N82-15843

STORAGE BATTERIES

Evaluation program for secondary spacecraft cells: Seventeenth annual report of cycle life test
[NASA-CR-165071] N82-15525

Energy storage systems for terrestrial solar generators — cadmium/mercury oxide cells
[BMFT-FB-T-81-082] N82-15529

Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes
[BMFT-FB-T-81-053] N82-15585

STORAGE STABILITY

Reservoir stability studies
[DE81-030099] N82-15510

Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891

STORAGE TANKS

Compressed-air energy-storage technology: Program overview
[DE81-030103] N82-15548

STORM DAMAGE

Climatology of high damaging wind in Illinois
[PB81-234767] N82-15693

STORMS

An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156883] N82-15678

STRAIN RATE

Indentation law for composite laminates
[NASA-CR-165460] N82-15123

Effects of misalignment on mechanical behavior of metals in creep
[NASA-CR-165055] N82-15166

Creep recovery and stress relaxation tests of 6061-0 aluminum
[NASA-CR-165056] N82-15167

STRATA

Elements for the numerical analysis of wave motion in layered media
[PB81-245268] N82-15292

STRATIFICATION

Fiscal year 1980-81 implementation plan in support of technical development and integration of sampling and aggregation procedures — crop acreage estimation
[E82-10013] N82-15491

STRATIGRAPHY

Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505

STREAK CAMERAS

Design of neutron streak camera for fusion diagnostics
[DE81-029866] N82-15426

STREAM FUNCTIONS (FLUIDS)

Steamflow characteristics of the Hudson Bay and upper Missouri River Basins, Montana, through 1979
[PB81-247199] N82-15523

STRESS ANALYSIS

Localized loads applied to shells of revolution
[KFK-CAD-155] N82-15470

Calculation of the stresses and the finite deflections of a perfect circular cylinder subjected to non-axisymmetric loads
[KFK-CAD-165] N82-15471

Stress dependence of creep in Ni bombarded with 17-MeV deuterons
[DE81-030080] N82-15869

STRESS RELAXATION

Creep recovery and stress relaxation tests of 6061-0 aluminum
[NASA-CR-165056] N82-15167

Finite-element program for creep analysis of concrete structures
[DE81-028071] N82-15460

STRESS-STRAIN DIAGRAMS

Calculation of the stress-strain evolution of a pressure-loaded trapezoid aluminum beam before and after reaching elastic limit
[EK47-059-80] N82-15468

STRESS-STRAIN RELATIONSHIPS

Thermomechanical response of Gr/PI composites
[NASA-CR-165753] N82-15124

Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178

Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029638] N82-15182

STRINGS

Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] N82-15561

STRIP MINING

Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] N82-15488

STRONG INTERACTIONS (FIELD THEORY)

Numerical studies of gauge field theories
[DE81-030526] N82-15846

STRUCTURAL ANALYSIS

Quantitative structural analysis of chromatically contrasted refractory alloys
[JUEL-1673] N82-15195

User's guide: Computer Program for Three-dimensional Analysis of Building Systems (CTABS80)
[AD-A105513] N82-15241

Representative ground parameters for structural analysis of tunnels. Volume 1: Rational approach to site investigation
[PB81-236432] N82-15256

Representative ground parameters for structural analysis of tunnels. Volume 3: Tunnel design and construction
[PB81-236440] N82-15257

NASTRAN user's guide (Level 17.5)
[NASA-CR-3146] N82-15456

In-situ electron microscope fracture studies of amorphous films
[DE81-028141] N82-15971

STRUCTURAL DESIGN

Heating and cooling applications of atriums and attached greenhouses: A state-of-the-art report
[DE81-022181] N82-15573

STRUCTURAL DESIGN CRITERIA

System analysis approach to deriving design criteria (Loads) for Space Shuttle and its payloads. Volume 2: Typical examples
[NASA-TP-1950] N82-15106

Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] N82-15221

Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-9] N82-15456

STRUCTURAL INFLUENCE COEFFICIENTS
Force and moment coefficients for high deflection cascades — theory behind a computer program
N82-15046

STRUCTURAL PROPERTIES (GEOLOGY)
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505

STRUCTURAL STABILITY
Structural safety analysis of proposed Harpoon test facility
[PML-1979-74] N82-15105
Experimental and theoretical study of a tall building subjected to wind loading
[DE81-029476] N82-15465

STRUCTURAL VIBRATION
Elements for the numerical analysis of wave motion in layered media
[PB81-246266] N82-15292

STRUCTURAL WEIGHT
Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366

SUBMERGED BODIES
Salvage of a USAF F-106 Delta Dart
[AD-A105610] N82-15240

SUBSONIC FLOW
Computation of subsonic flow around airfoil systems with multiple separation
[DFVLR-FB-81-24] N82-15021
Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow N82-15051
Numerical experiments on unsteady flows through vibrating cascades N82-15052

SUBSONIC FLUTTER
Damping for turbomachine blade variations in subsonic flow N82-15048

SUBSONIC SPEED
DONBOL: A computer program for predicting axisymmetric nozzle afterbody pressure distributions and drag at subsonic speeds
[NASA-TM-78779] N82-15016

SUBSONIC WIND TUNNELS
Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report)
[NASA-CR-165806] N82-15014

SUBSTRATES
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176
Thin film adhesion and deadhesion
[DE81-026415] N82-15206
The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15962

SUCTION
A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031

SULFATES
Air quality data for nonmetallic inorganic ions: Nitrate and sulfate for 1977 and 1978 from the National Air Surveillance Networks
[PB81-248148] N82-15647

SULFATION
Thermodynamics and kinetics of the sulfation of porous calcium silicate
[NASA-TM-82769] N82-15119

SULFITES
Oxidation pf metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15566

SULFUR
Relative effects of S, Sb and P on the intergranular fracture of iron and nickel tested at cathodic potentials
[DE81-030076] N82-15183

SULFUR DIOXIDES
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] N82-15607
Use of coal cleaning for compliance with SO2 emission regulations
[PB81-247520] N82-15618

SULFUR FLUORIDES
Development of power system measurements
[PB81-246860] N82-15355

SULFUR OXIDES
Process for removing sulfur oxides from gases with direct production of a usuable finished reaction product — ammonium sulfate fertilizer
[BMFT-FB-T-81-102] N82-15142
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514

SUPERCONDUCTING MAGNETS
Development of force-cooled superconductors for use in large magnets
[DE81-028067] N82-15343
Gas cooled electrical leads for use on forced cooled superconducting magnets
[DE81-029855] N82-15346
Evaluation of shielded metal arc and flux cored metal arc welding consumables for fabrication of stainless steel magnet cases for 4K service
[DE81-028851] N82-15449
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949
MAGCOOL: The production cooling facility for ISABELLE magnets
[DE81-030554] N82-15952

SUPERCONDUCTING POWER TRANSMISSION
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] N82-15338

SUPERCONDUCTIVITY
Comparison of hydrostatic extrusion versus wire drawing as a method of producing Nbsub3Sn superconducting wire
[DE81-030275] N82-15251
Superconducting critical current density as a probe of defects in metallic glasses
[DE81-028136] N82-15341

SUPERCONDUCTORS
Testing results of MF-Nbsub3Sn
[DE81-026632] N82-15135
Development of force-cooled superconductors for use in large magnets
[DE81-026067] N82-15343

SUPERCRITICAL WINGS
Low-speed aerodynamic performance of a high-aspect-ratio supercritical-wing transport model equipped with full-span slat and part-span double-slotted flaps
[NASA-TP-1580] N82-15015
Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing
[NASA-TP-1360] N82-15075

SUPERHIGH FREQUENCIES
Characterization of GaAs superhigh frequency field effect power transistors in the nonlinear mode
[ENST-E-81001] N82-15352

SUPERNOVAE
Supernova hydrodynamics
[DE81-030243] N82-16027

SUPERSATURATION
The CCN counter of the IOPG of Puy de Dome: Main characterisics and results of measurements
N82-15386
UMR dual mode CCN counter (modes: CFD plus haze) N82-15387
A cloud condensation nucleus spectrometer designed for airborne measurements N82-15388
Static diffusion cloud chambers N82-15389
An airborne isothermal haze chamber N82-15390
Diffusion tube N82-15393
Description of the NRL isothermal haze chamber
N82-15395
CCN comparisons of static diffusion chambers
N82-15399
CCN-supersaturation spectra slopes (k)
N82-15400
Performance of the continuous flow diffusion chambers N82-15402
Review of isothermal haze chamber performance
N82-15403

SUPERSONIC AIRCRAFT
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079

SUPERSONIC FLOW
Influence of three-dimensional effects on the supersonic flow field at the leading edge of a turbomachine cascade
[EPFL-ITA-9] N82-15012
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060
Calculation of unstarted-choked regime of supersonic and transonic compressor cascades
N82-15364

SUPERSONIC FLUTTER
Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans
N82-15058
Effect of mean blade loading on supersonic cascade flutter N82-15059

SUPPORT INTERFERENCE
Vertical motion of highway bridge structure due to an earthquake
[PB81-235319] N82-15254

SURFACE DEFECTS
Slow positrons in the study of surface and near-surface defects
[DE81-030027] N82-15976

SURFACE FINISHING
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176
On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-63] N82-15448
An evaluation of engineering control technology for spray painting
[PB81-243123] N82-15789

SURFACE GEOMETRY
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15196

SURFACE LAYERS
Interfacial structures in nickel-based transition joints after long term service
[DE81-903971] N82-15155
Environmental controls on the composition of the surface microlayer in Lake Michigan
[PB81-239006] N82-15617
Surface science of heterogeneous catalysis: Possible applications in atmospheric sciences
[DE81-028135] N82-15663

SURFACE PROPERTIES
Light depolarization as a measure of pavement surface texture
[PB81-241507] N82-15253

SURFACE REACTIONS
Chemical modification of TiO2 surfaces with methylsilanes and characterization by infrared absorption spectroscopy
[NASA-CR-165063] N82-15139
Mechanistic studies of carbon monoxide reduction
[DE81-030063] N82-15157
Surface science of heterogeneous catalysis: Possible applications in atmospheric sciences
[DE81-028135] N82-15663

SURFACE ROUGHNESS
Investigation of a coherent optical method for roughness measurements
[BMFT-FB-T-81-065] N82-15923

SURFACE TEMPERATURE
Analysis of the surface heat balance over the world ocean
[NASA-CR-165072] N82-15699

SURFACE WATER
Research programme 1981/82 — water science
N82-15474
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515
Water Resources Data for Wisconsin, water year 1980
[PB81-235186] N82-15516
Water resources data for Idaho, water year 1980. Volume 2: Upper Columbia River Basin and Snake River Basin below King Hill
[PB81-244196] N82-15518

SURFACE WAVES
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156862] N82-15496
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706
HF radar measurements of surface currents in the German Bight during MARSEN phase 2
[PB81-244410] N82-15707

SURVEYS
OSTA/ADS standards development process
N82-15098
Overview of the current MITRE effort N82-15099
The composing process in technical communications N82-15993
The composing process of technical writers: A preliminary study N82-15996
Analysis of responses to survey of DTIC's military users on current and planned technical library/information center automation
[AD-A105507] N82-15999
SURVIVAL
Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841
SWELLING
Effects of transmutation products on swelling in 316 stainless steel
[DE81-029805] N82-15190
Swelling of several commercial alloys following high fluence neutron irradiation
[DE81-029804] N82-15191
Microstructural examination of several commercial ferritic alloys irradiated to high fluence
[DE81-029800] N82-15192
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
SWITCHING CIRCUITS
Electrical switching in cadmium boracite single crystals N82-15325
Microcomputer and LSI compatible power switch
[BMFT-FB-T-81-093] N82-15793
SYMBOLIC PROGRAMMING
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 1: Overview
[AD-A106102] N82-15284
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 2: Knowledge base
[AD-A106103] N82-15285
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 3: Program source files
[AD-A106104] N82-15286
SYMMETRY
Calculation of the stresses and the finite deflections of a perfect circular cylinder subjected to non-axisymmetric loads
[KFK-CAD-165] N82-15471
Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834
SYNCHROTRON RADIATION
National synchrotron light source in the infrared region
[DE81-030037] N82-15932
Applications of bent cylindrical mirrors to X-ray beamlines
[DE81-029918] N82-15936
SYNOPTIC METEOROLOGY
An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156883] N82-15678
Synoptic and upper air observations in the Netherlands, volume 24
[KNMI-142-24] N82-15685
Synoptic and upper air observations in the Netherlands, volume 25
[KNMI-142-25] N82-15686
SYNTHESIS (CHEMISTRY)
An assessment of nonfossil hydrogen
[PB81-246522] N82-15231
SYNTHETIC APERTURE RADAR
Study of the influence of precipitations and clouds on the performance of synthetic aperture radars
[ESA-CR(P)-1465] N82-15290
Additional studies of Earth resources synthetic aperture radar payloads
[MTR-80/90] N82-15500
New baseline system N82-15501
Squinted SAR system N82-15502
High speed techniques for synthetic aperture radar image formation N82-15898
SYNTHETIC FOOD
All-Union Conference on New Sources of Food Protein and Their Application N82-15765
SYNTHETIC FUELS
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] N82-15509
SYSTEMS ANALYSIS
Projected Markov parameters and multivariable root-loci
[RR-148] N82-15839
SYSTEMS ENGINEERING
Propagation effects handbook for satellite systems design: A summary of propagation impairments on 10 to 100 GHz satellite links with techniques for system design
[NASA-RP-1082] N82-15270
Application of propagation predictions to Earth/space telecommunications system design
N82-15276
Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366
Use of Zernike polynomials and interferometry in the optical design and assembly of large carbon-dioxide laser systems
[DE81-030138] N82-15443
Development of a prototype of a 10 kW small solar power plant — technology for developing nations
[BMFT-FB-T-81-101] N82-15532
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949
SYSTEMS INTEGRATION
Space Transportation System Cargo projects: Inertial stage/spacecraft integrationn plan. Volume 1: Management plan
[NASA-CR-165088] N82-15115
SYSTEMS MANAGEMENT
Federal records management: A history of neglect
[PB81-237133] N82-15983
SYSTEMS SIMULATION
Hysteresis identification of multi-story buildings
[PB81-235921] N82-15260

T

TAPE RECORDERS
Digital recording of video signals on magnetic tape at 40 M bit/sec
[BMFT-FB-T-81-084] N82-15410
TARGET ACQUISITION
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111
Improvement of radar target searches by a range dependent detection threshold or signal amplification
[FFM-301] N82-15285
The optical recognition of sea targets as a function of surrounding and observation parameters in air to water observations
[BMVG-FBWT-81-10] N82-15930
TARGET RECOGNITION
Survey of the observer's performance with remotely piloted vehicles — on target recognition
[BMVG-FBWT-81-3] N82-15036
The optical recognition of surface targets as a function of surrounding, target and observation parameters in air to surface observations
[BMVG-FBWT-81-8] N82-15929
The optical recognition of sea targets as a function of surrounding and observation parameters in air to water observations
[BMVG-FBWT-81-10] N82-15930
TASK COMPLEXITY
Simulator data on human error probabilities
[DE81-026094] N82-15786
TECHNICAL WRITING
Technical communication. Perspectives for the Eighties, part 2
[NASA-CP-2203-PT-2] N82-15986
Some technical writing skills industry needs
N82-15987
Technical writing versus technical writing
N82-15988
Whys and hows of in-house writing N82-15989
Technical writing practically unified through industry N82-15990
The composing process in technical communication N82-15991
A case study of the influences of audience and purpose on the composing processes of an engineer
N82-15992
The composing process in technical communications N82-15993
Using sentence combining in technical writing classes N82-15994
Teaching audience analysis to the technical student N82-15995
The composing process of technical writers: A preliminary study N82-15996
Analogical acts as conceptual strategies in science, engineering and the humanities N82-15997
Trends in liability affecting technical writers
N82-15998
TECHNOLOGY ASSESSMENT
Aeronautical applications of bonding
[SNIAS-812-551-102] N82-15010
Filament winding — general principles
N82-15131
US ceramic heat exchanger technology: Status and opportunities
[DE81-029886] N82-15210
State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262
Safety, reliability, cost reduction: Permanent objectives of the modern aerospace industry and how studies in tribology contribute to the formulation of future solutions
[SNIAS-812-551-111] N82-15451
Micro-hydropower in the United States
[DE81-026271] N82-15567
Air Pollution Pilot Study: Assessment methodology and modeling, 1975 - 1979 (first follow-up report)
[PB81-242257] N82-15629
Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
Community rotorcraft air transportation benefits and opportunities
[NASA-CR-166266] N82-16008
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012
TECHNOLOGY TRANSFER
NASA: Technology transfer
[NASA-TM-84070] N82-16009
TECHNOLOGY UTILIZATION
Applications of composites in missiles and missile launchers N82-15128
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] N82-15488
NASA biomedical applications team. Applications of aerospace technology in biology and medicine
[NASA-CR-152663] N82-15710
Applications of aerospace technology in biology and medicine
[NASA-CR-159106] N82-15769
Technology of controlled nuclear fusion
[DE81-027361] N82-15893
TELECOMMUNICATION
Data protection of computer aided telecommunication systems
[BMFT-FR-DV-81-006] N82-15282
TELESCOPES
A cosmic ray experiment on board the solar probes HELIOS 1 and 2 (experiment number 6)
[BMFT-FB-W-81-016] N82-16039
TELETYPEWRITER SYSTEMS
EDITEX: A telex text-editor based on an 8085 microprocessor
[PHL-1980-06] N82-15795
TELEVISION CAMERAS
Field tests of a Thorn EMI acoustic camera used in an underwater acoustic television system
[FOA-C-30225-E1] N82-15432
TELEVISION EQUIPMENT
Integrated circuits for TV and radio applications
[BMFT-FB-T-81-088] N82-15279
TELEVISION SYSTEMS
Field tests of a Thorn EMI acoustic camera used in an underwater acoustic television system
[FOA-C-30225-E1] N82-15432

Use of a television multipoint x-y tracker for determining the transmission of vibrations on human beings — human factors in man machine systems
N82-15787

TELLURIC CURRENTS
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] N82-15656

TEMPERATURE
Damage development and hardening in 14 MeV neutron irradiation of copper alloys at 25 deg C
[DE81-029780] N82-15189
Determination of nuclear-matter temperature and density
[DE81-023847] N82-15865

TEMPERATURE CONTROL
Comfortable temperature and tolerable temperature N82-15753

TEMPERATURE DEPENDENCE
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15206
The relationship of body temperature to environmental temperature N82-15752

TEMPERATURE EFFECTS
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079
Thermomechanical response of Gr/Pi composites
[NASA-CR-165753] N82-15124
Effect of cyclic pulsed temperature on void growth in metals during irradiation
[DE81-030112] N82-15188
Finite-element program for creep analysis of concrete structures
[DE81-026071] N82-15460
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029660] N82-15507
The relationship of body temperature to environmental temperature N82-15752

TEMPERATURE GRADIENTS
Heating remote rooms in passive solar buildings
[DE81-030247] N82-15248
Modified MEE Industries static thermal gradient diffusion cloud chamber N82-15396
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] N82-15925

TEMPERATURE MEASUREMENT
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845

TEMPERATURE PROFILES
The effect of fire retardants on the heat-release rate of building materials
[PB81-236487] N82-15259
One and two dimensional modeling of the planetary boundary layer
[MITT-29] N82-15668

TENSILE DEFORMATION
Effects of tensile deformation on the strain memory behavior of uranium-niobium alpha double prime martensite
[DE81-030285] N82-15184

TENSILE STRESS
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

TENSILE TESTS
Study of traction rupture strength or graphite-epoxy composite material laminates T300/5208, with and without a central hole
[REPT-137] N82-15138

TERMINAL BALLISTICS
Hull/EPIC3 linked Eulerian/Lagrangian calculation in three dimension
[AD-A106033] N82-15368

TERMINAL GUIDANCE
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111

TERMINOLOGY
Definitions of CAMAC terms
[DE81-028247] N82-15801

TERRESTRIAL RADIATION
Analysis of satellite observations: Theoretical studies on the sampling problem
[MITT-31] N82-15499

TEST CHAMBERS
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176

TEST FACILITIES
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079
Structural safety analysis of proposed Harpoon test facility
[PML-1979-74] N82-15105

TEST VEHICLES
Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019

TETRODES
Improvement of tetrode power amplifier efficiency by adding harmonics to the carrier oscillation and energy savings resulting from volume-dependent Pulse-Duration Modulation (PDM) control
[BMFT-FT-T-81-163] N82-15309

TEXAS
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] N82-15225
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505

TEXTURES
Light depolarization as a measure of pavement surface texture
[PB81-241507] N82-15253

THEMATIC MAPPING
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156892] N82-15498

THEOREMS
Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840

THEORIES
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599

THERMAL CONDUCTIVITY
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705
A heat transfer analysis of scald injury
[PB81-238503] N82-15777
Illustrative numerical comparisons between phonon mean free paths and phonon thermal conductivity
[DE81-028180] N82-15863
Thermal conductivity measurements of insulators for fusion blankets
[DE81-030028] N82-15953

THERMAL CONDUCTIVITY GAGES
Development of a prototype of a test apparatus for the determination of the thermal conductivity in solids, on powders and foams
[BMFT-FB-T-81-052] N82-15409

THERMAL CONDUCTORS
Development of a prototype of a test apparatus for the determination of the thermal conductivity in solids, on powders and foams
[BMFT-FB-T-81-052] N82-15409

THERMAL CYCLING TESTS
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

THERMAL DECOMPOSITION
High temperature electrical conductivity and thermal decomposition of phenolic and silicon based dielectrics for fireset housings
[DE81-031919] N82-15137
Electrical conductivity and thermal decomposition of high temperature phenolic- and silicone-based materials
[DE81-023177] N82-15206

Oxidation of metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15566

THERMAL DIFFUSION
Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366
Diffusion tube N82-15393
Modified MEE Industries static thermal gradient diffusion cloud chamber N82-15396

THERMAL DISSOCIATION
Thermolysis of naphthols
[DE81-029684] N82-15152

THERMAL ENERGY
Investigation of medium and high temperature phase change materials for thermal energy storage
[BMFT-FB-T-81-149] N82-15536
Industrial process heat applications for solar thermal technologies
[DE81-025934] N82-15545
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576

THERMAL EXPANSION
Thermomechanical response of Gr/Pi composites
[NASA-CR-165753] N82-15124
Study and development of high strength composite material structures by the Thermomechanical Department of the Space Division of Matra
N82-15127

THERMAL FATIGUE
Thermal-fatigue properties of coated materials for fusion-device applications
[DE81-028367] N82-15463

THERMAL INSULATION
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] N82-15571
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] N82-15579
A criterion for the disposal of M58 sleeping bags
[IZF-1979-15] N82-15782
Thermal conductivity measurements of insulators for fusion blankets
[DE81-030028] N82-15953

THERMAL MAPPING
Geologic applications of thermal-inertia mapping from satellite — Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489
Preparation of magnetic anomaly profile and contour maps from DOE-NURE aerial survey data. Volume 1: Processing procedures
[DE81-030700] N82-15562
An investigation into the applicability of thermal infrared scanning for exploration
[BMFT-FB-T-81-087] N82-15925

THERMAL NEUTRONS
Selected topics in thermal and resonance neutron capture
[DE81-029676] N82-15864

THERMAL RADIATION
Biological patchiness in relation to satellite thermal imagery and associated chemical mesoscale features
[AD-A105757] N82-15504
The ROSCOE manual. Volume 28-1: Molecular band model parameters for thermal emissions: Expanded wavelength coverage
[AD-A106077] N82-15659

THERMAL RESOURCES
Industrial process heat applications for solar thermal technologies
[DE81-025934] N82-15545

THERMAL STABILITY
Quality control of composites: Activities and instituted means
[N-25.855/R.E.Q.C.] N82-15130

THERMIONICS
Development of integrated thermionic circuits for high-temperature applications N82-15321

THERMOCHEMICAL PROPERTIES
Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair
[DE81-030235] N82-15581

THERMOCHEMISTRY
Thermochemical production of liquids from biomass
[DE81-030085] N82-15226
Oxidation of metal sulfites by iodine for use in thermochemical hydrogen cycles
[DE81-030253] N82-15588
SERI Solar-Energy-Storage Program
[DE81-029476] N82-15576
Hydrogen production based on magnetic fusion
[DE81-029636] N82-15948

THERMODYNAMIC EFFICIENCY
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] N82-15537
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] N82-15561

THERMODYNAMIC PROPERTIES
Thermodynamics and kinetics of the sulfation of porous calcium silicate
[NASA-TM-82769] N82-15119
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359
Transwall: A modular visually transmitting thermal storage wall
[DE81-029621] N82-15579
Temperature histories in geothermal wells: Survey of rock thermomechanical properties and drilling, production, and injection case studies
[DE81-029957] N82-15662

THERMODYNAMICS
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028896] N82-15242
The behavior of surface wind and thermodynamic fields in the presence of deep convection
[AD-A105895] N82-15687
Technology of controlled nuclear fusion
[DE81-027361] N82-15893

THERMOELASTICITY
Thermomechanical response of Gr/Pi composites
[NASA-CR-165753] N82-15124

THERMOELECTRICITY
Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557

THERMOHYDRAULICS
Technology of controlled nuclear fusion
[DE81-027361] N82-15893

THERMOMECHANICAL TREATMENT
Thermomechanical dynamic analysis of a prepreg: Applications to industrial baking — polymerization and compression of molded materials
[SNIAS-812-551-105] N82-15212
Characterization of the polymerization of an impregnation resin: Application to industrial baking
[SNIAS-812-551-107] N82-15213
Automation of a 5 m rolling mill for thermomechanical rolling of heavy plate
[KFK-PDV-166] N82-15252

THERMOMETERS
Production and use of high-grade silicon-diode temperature sensors
[DE81-030547] N82-15424

THERMONUCLEAR EXPLOSIONS
Supernova hydrodynamics
[DE81-030243] N82-16027

THERMOPHYSICAL PROPERTIES
NBS: Materials measurements
[NASA-CR-165076] N82-15121

THERMOPLASTIC RESINS
Development of optical plastics
[BMFT-FB-T-81-121] N82-15927

THERMOSETTING RESINS
Filament winding — general principles
N82-15131

THERMOSPHERE
Thermospheric studies using satellites AEROS A and B — atmospheric total density determination by the orbital drag technique
[BMFT-FB-W-81-012] N82-15667

THICK FILMS
Thin film adhesion and deadhesion
[DE81-028415] N82-15206

THICKNESS
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457

THIN FILMS
On two-six thin film technology for the preparation of active luminescing areas
[BMFT-FB-T-81-118] N82-15144
Thin film adhesion and deadhesion
[DE81-028415] N82-15206
Development of a thin film preparation technique for ZrO2(Y2O3) electrolytes on porous support structures
[BMFT-FB-T-81-143] N82-15307
Passive components for high temperature operation N82-15314
Amorphous metallizations for high-temperature semiconductor device applications N82-15318
Development of integrated thermionic circuits for high-temperature applications N82-15321
Stuffed MO layer as a diffusion barrier in metallizations for high temperature electronics
N82-15335
High temperature (Al2O3) insulation and light weight conductors N82-15337
Some considerations regarding film thickness standards for the semiconductor industry
[PB81-239535] N82-15357
Process development for large-scale production of CdS thin film solar cells Sputtered copper sulfide layers and cadmium sulfide-copper sulfide heteorojunctions. Application of high rate sputtering using hot-pressed targets
[BMFT-FB-T-81-069] N82-15528
Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535
Development of a process for an inexpensive production of thin film solar cells on an industrial scale
[BMFT-FB-T-81-159] N82-15539
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] N82-15569

THIN WALLED SHELLS
Localized loads applied to shells of revolution
[KFK-CAD-155] N82-15470

THOMSON SCATTERING
A compilation of Rayleigh cross sections for the laser diagnostics of plasmas — for calibration of Thomson scattering
[IPF-80-10] N82-15959

THREE BODY PROBLEM
Continuum capture in the three-body problem
[DE81-025467] N82-15980

THREE DIMENSIONAL FLOW
Influence of three-dimensional effects on the supersonic flow field at the leading edge of a turbomachine cascade
[EPFL-ITA-9] N82-15012
Three-dimensional periodic disturbances acting upon airfoils in cascade N82-15064
Hull/EPIC3 linked Eulerian/Lagrangian calculation in three dimension
[AD-A106033] N82-15368
Calculation of three-dimensional instability modes in a Blasius boundary layer
[IC-AERO-81-01] N82-15377

THREE DIMENSIONAL MOTION
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062
User's guide: Computer Program for Three-dimensional Analysis of Building Systems (CTABS80)
[AD-A105513] N82-15241

THROATS
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457

THYRISTORS
Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298
Control of the minority carrier lifetime of silicon devices using electron irradiation
[BMFT-FB-T-81-037] N82-15349

TIDAL WAVES
Global ocean tides. Part 7: The diurnal principal solar tide (P1), atlas of tidal charts and maps
[AD-A105812] N82-15700
HF radar measurements of surface currents in the German Bight during MARSEN phase 2
[PB81-244410] N82-15707

TIDES
Global ocean tides. Part 7: The diurnal principal solar tide (P1), atlas of tidal charts and maps
[AD-A105812] N82-15700

TILT ROTOR RESEARCH AIRCRAFT PROGRAM
XV-15 Tilt Rotor fly-by-wire collective control demonstrator development specifications
[NASA-CR-166262] N82-15030

TIMBER IDENTIFICATION
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490

TIMBER VIGOR
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481

TIME DEPENDENCE
Design of neutron streak camera for fusion diagnostics
[DE81-029866] N82-15426

TIME LAG
Computer program for computing and plotting Bode, phase, and Nyquist diagrams and time responses of given frequency transfer functions
[LEOK-TR-1979-13] N82-15815
A broadband RF continuously variable time delay device — using Bragg cell and optical heterodyne technology for signal processing N82-15915

TIME SERIES ANALYSIS
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15560

TIN
Comparison of hydrostatic extrusion versus wire drawing as a method of producing Nbsub3Sn superconducting wire
[DE81-030275] N82-15251
Superconducting current densities in bronze-processed Nb3Sn multifilamentary wires
[DE81-030566] N82-15344

TITANATES
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-026386] N82-15209

TITANIUM ALLOYS
Advantages and limitations in the use of diverse materials for aircraft construction — composite versus metallic materials
[SNIAS-811-551-104] N82-15011
Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

TITANIUM COMPOUNDS
Dissolution of surface oxide layers on titanium and titanium subhydride between 25 and 700 C
[DE81-028044] N82-15136

TITANIUM OXIDES
Chemical modification of TiO2 surfaces with methylsilanes and characterization by infrared absorption spectroscopy
[NASA-CR-165063] N82-15139
Chemical modification of semiconductor surfaces
[NASA-CR-165066] N82-15140

TOKAMAK DEVICES
Cryopumping of hydrogen and helium
[DE81-030553] N82-15246
Thermal-fatigue properties of coated materials for fusion-device applications
[DE81-026367] N82-15463
Lower hybrid rf heating experiments in the MIT Alcator A, C and Versator II Tokamaks
[DE81-026193] N82-15941
Breakdown in the PRETEXT Tokamak
[DE81-029362] N82-15945
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas — estimate of plasma temperature
[JUEL-1666] N82-15958

TOOLING
Perspective on precision machining, polishing, and optical requirements
[DE81-028008] N82-15244

Optical tooling for Antares
[DE81-030298] N82-15444

TOOLS
Stamping tools made of resin N82-15132

TOPOGRAPHY
Topography of the electrical properties of the silicon/oxide interface and the influence of technologic treatments
[BMFT-FB-T-81-096] N82-15301

TOROIDAL PLASMAS
Equilibrium and stability of experimental high beta toroidal plasmas
[DE81-029810] N82-15944
Current driven nonideal instability in a force-free toroidal plasma
[DE81-029862] N82-15956
An estimate of convection cooling in the boundary layer of toroidal fusion plasmas — estimate of plasma temperature
[JUEL-1696] N82-15958

TORSIONAL STRESS
Flag-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013

TOUGHNESS
Toughening in glass ceramics through microstructural design
[DE81-030209] N82-15207

TOWERS
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] N82-15530

TOXIC DISEASES
Caisson disease N82-15749
Oxygen toxication N82-15751

TOXIC HAZARDS
Formation and spreading of explosive and toxic gas clouds. A study of the literature
[FOA-C-40141-C1] N82-15379
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636
Research outlook, 1981 — toxic hazard research and control
[PB81-243495] N82-15640
The physiological effect of low-air-pressure anoxia
N82-15748

TOXICITY
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600

TOXICITY AND SAFETY HAZARD
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236461] N82-15645

TOXICOLOGY
Shuttle toxicology N82-15726

TRACE ELEMENTS
Precise trace rare Earth analysis by radiochemical neutron activation
[DE81-030009] N82-15153
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-236479] N82-15624

TRACKED VEHICLES
The Link-Miles driver training simulator for tracked vehicles: A validation study
[IZF-1979-23] N82-15060
The Link-Miles driver training simulator for tracked vehicles: Influence of cabin motion on gear-change learning
[IZF-1980-24] N82-15785

TRAILERS
Mobile infiltration test unit: Its design and capabilities, preliminary experimental results
[DE81-031827] N82-15245

TRAINING ANALYSIS
The composing process of technical writers: A preliminary study N82-15996

TRAINING SIMULATORS
The Link-Miles driver training simulator for tracked vehicles: A validation study
[IZF-1979-23] N82-15060
The Link-Miles driver training simulator for tracked vehicles: Influence of cabin motion on gear-change learning
[IZF-1980-24] N82-15785

TRAJECTORY ANALYSIS
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111

TRANSFER FUNCTIONS
Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461
Computer program for computing and plotting Bode, phase, and Nyquist diagrams and time responses of given frequency transfer functions
[LEOK-TR-1979-13] N82-15815
Quadrantal symmetry calculations for nonsymmetric half-plane filters
[DE81-030071] N82-15834
Projected Markov parameters and multivariable root-loci
[RR-146] N82-15839

TRANSFER OF TRAINING
The Link-Miles driver training simulator for tracked vehicles: A validation study
[IZF-1979-23] N82-15060
Solar energy training program for code enforcement personnel
[DE81-030053] N82-15563

TRANSISTOR CIRCUITS
Assessment of high temperature metallizations for I(2)L and CMOS technologies N82-15317

TRANSLUCENCE
Temperature measurements of shocked translucent materials by time-resolved infrared radiometry
[DE81-028426] N82-15845

TRANSMISSION CIRCUITS
Component outage data analysis methods. Volume 1: Overview and special applications
[DE81-904214] N82-15339
Component outage data analysis methods. Volume 2: Basic statistical methods
[DE81-904197] N82-15340

TRANSMISSION EFFICIENCY
Attenuation of coaxial pairs in the lower frequency range
[FTZ-FI-21-TBR-51] N82-15268

TRANSMISSION LINES
Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 2: Physics of electron beam irradiation of cables and wires
[BMFT-FB-T-81-123-VOL-2] N82-15201
Investigation of geomagnetically induced currents in the proposed Winnipeg-Duluth-twin cities 500-kV transmission line
[DE81-904233] N82-15345

TRANSMISSION LOSS
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] N82-15338

TRANSMUTATION
Effects of transmutation products on swelling in 316 stainless steel
[DE81-029805] N82-15190
Electrical property studies of oxygen in Czochralski-grown neutron-transmutation-doped silicon
[DE81-028143] N82-15974

TRANSONIC COMPRESSORS
Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans
N82-15058

TRANSONIC FLOW
Evaluation of a dresserator system test vehicle
[PB81-245722] N82-16019

TRANSONIC WIND TUNNELS
Correlation of transonic-cone Preston-tube data and skin friction — characterizing the flow quality of a transonic wind tunnel
[NASA-CR-165065] N82-15019
Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing
[NASA-TP-1360] N82-15075

TRANSPONDERS
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167456] N82-15114

TRANSPORT AIRCRAFT
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

TRANSPORT PROPERTIES
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15389
Analysis of column tracer experiments by a stochastic-convective transport method
[DE81-030066] N82-15375
Hydrodynamic and chemical modeling of heavy metals in ash pond leachates
[DE81-028510] N82-15601

TRANSPORTATION NETWORKS
Geologic hazards and their relation to planning, location, and design of transportation facilities
[PB81-235467] N82-16020

TRAVELING WAVES
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15386

TRIBOLOGY
Geometrical aspects of the tribological properties of graphite fiber reinforced polymide composites
[NASA-TM-82757] N82-15198
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-15199
Safety, reliability, cost reduction: Permanent objectives of the modern aerospace industry and how studies in tribology contribute to the formulation of future solutions
[SNIAS-812-551-111] N82-15451

TRIGGER CIRCUITS
Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298

TRINITROTOLUENE
High-explosive detonations in varying-oxygen atmospheres
[DE81-026179] N82-15226

TRITIUM
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177
Tritium autoradiography
[DE81-030521] N82-15670

TROMBE WALLS
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] N82-15579

TROPICAL STORMS
National Hurricane operations plan
[PB81-247231] N82-15697

TROPOSPHERE
The CHON photochemistry of the troposphere: GRASSLANDS project (summer colloquium 1980)
[PB81-233140] N82-15672

TROPOSPHERIC SCATTERING
Depolarization on Earth-space paths N82-15273

TRUCKS
Air quality analysis for the 1984 High Altitude Report to Congress: Summary of results
[PB81-247702] N82-15620

TSUNAMI WAVES
Water waves generated by three dimensional bed motion: Abstract
[PB81-238172] N82-15674

TUBE HEAT EXCHANGERS
Development of a modular heat exchanger with integrated latent heat energy store — for solar heating applications
[BMFT-FB-T-81-050] N82-15584

TUNGSTEN
NBS: Materials measurements
[NASA-CR-165076] N82-15121

TUNNELING (EXCAVATION)
Representative ground parameters for structural analysis of tunnels. Volume 1: Rational approach to site investigation
[PB81-236432] N82-15256

Representative ground parameters for structural analysis of tunnels. Volume 3: Tunnel design and construction
[PB81-236440] N82-15257

TURBINE BLADES
Stability and flutter analysis of turbine blades at low speed N82-15050
On the numerical analysis of stall flutter in turbine cascades N82-15054
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072

TURBINE ENGINES
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041

TURBOCOMPRESSORS
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039
Practical experience with a noncontact blade vibration measuring system in industrial turbocompressors — vibration mode identification N82-15065

TURBOFANS
Stability analysis of the twin mode model of coupled flexion/torsion vibrations in turbofans N82-15057
Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans N82-15056

TURBOMACHINE BLADES
Influence of three-dimensional effects on the supersonic flow field at the leading edge of a turbomachine cascade
[EPFL-ITA-9] N82-15012
Calculation of hydrodynamic interaction of the arbitrary profile cascades in the flow of ideal liquid N82-15043
Aerodynamic analysis of cascaded airfoils in unsteady rotational flow — prediction of flow induced vibrational stress N82-15044
Aerodynamic response of a blade in pitching oscillation with partial and full separation — measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel N82-15047
Damping for turbomachine blade variations in subsonic flow N82-15048
Self excited flow oscillation in the low pressure steam turbine cascade N82-15049
Numerical experiments on unsteady flows through vibrating cascades N82-15052
Computer aided investigation of turbomachine aerodynamics and aeroelasticity N82-15053
A method for force determination from vibration response measurements — application to turbomachine blades N82-15055
Effect of mean blade loading on supersonic cascade flutter N82-15059
Calculation of nonstationary force ratios on blades of a rotating row in incompressible flow N82-15061
The effect of aspect ratio on the unsteady aerodynamic forces induced by vibration of a cascade blade N82-15063
Three-dimensional periodic disturbances acting upon airfoils in cascade N82-15064
Acta mechanica sinica (selected articles)
[AD-A106123] N82-15362
Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

TURBOMACHINERY
Aspects of acoustic resonance phenomena in turbomachines N82-15069
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter — turbomachinery applications
[MITT-79-04] N82-15429

TURBULENT FLOW
Sound measurement in flows: Determination of the noise level due to turbulent pressure variations by comparing the measurements with a nose cone and with a slotted tube N82-15850

TWO DIMENSIONAL BOUNDARY LAYER
One and two dimensional modeling of the planetary boundary layer
[MITT-29] N82-15668

U

U.S.S.R.
USSR report: Life sciences biomedical and behavioral sciences, no. 13
[JPRS-79639] N82-15763

U.S.S.R. SPACE PROGRAM
Meteorological satellites
[AD-A107427] N82-15110

ULTRAHIGH VACUUM
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419

ULTRASONIC RADIATION
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775

ULTRASONICS
Quality control of composites: Activities and instituted means
[N-25.855/R.E.Q.C.] N82-15130

ULTRAVIOLET RADIATION
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-238578] N82-15148
Ultraviolet disinfection of a secondary wastewater treatment plant effluent
[PB81-242125] N82-15648

ULTRAVIOLET SPECTROMETERS
Auroral spectrometer AF6 for the POLAR HIGH ATMOSPHERE rocket campaign
[BMFT-FB-W-81-006] N82-15665
Spectrophotometric studies on the RNA structure in E.coli ribosomes. Part 1: Fundamentals of ultraviolet spectrophotometry of nuclei acids
[ISS-R-80/2-PT-1] N82-15734

UNDERGROUND EXPLOSIONS
Development of tests and criteria to evaluate grounding systems
[PB81-238354] N82-15522

UNDERGROUND STORAGE
Reservoir stability studies
[DE81-030099] N82-15510
Compressed-air energy-storage technology: Program overview
[DE81-030103] N82-15546
Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891

UNDERGROUND STRUCTURES
Representative ground parameters for structural analysis of tunnels. Volume 1: Rational approach to site investigation
[PB81-236432] N82-15256
Representative ground parameters for structural analysis of tunnels. Volume 3: Tunnel design and construction
[PB81-236440] N82-15257
Microbiologic aspects of metal corrosion N82-15764

UNDERWATER ACOUSTICS
Field tests of a Thorn EMI acoustic camera used in an underwater acoustic television system
[FOA-C-30225-E1] N82-15432

UNDERWATER STRUCTURES
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380
Microbiologic aspects of metal corrosion N82-15764

UNIVERSE
Neutrino number of the universe
[DE81-030249] N82-15875

UNLOADING WAVES
Indentation law for composite laminates
[NASA-CR-165460] N82-15123

UNSTEADY FLOW
Self excited flow oscillation in the low pressure steam turbine cascade N82-15049
Numerical experiments on unsteady flows through vibrating cascades N82-15052
The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365

UPPER ATMOSPHERE
Aeronomy satellites AEROS A and B: The assistance to the project by the project scientist
[BMFT-FB-W-81-029] N82-15109
The mass spectrometer experiment in the program AEROS
[BMFT-FB-W-81-030] N82-15657
Synoptic and upper air observations in the Netherlands, volume 24
[KNMI-142-24] N82-15685
Synoptic and upper air observations in the Netherlands, volume 25
[KNMI-142-25] N82-15686
Experimental design and data of the August 1980 Corral Gulch nocturnal wind experiment, Piceance Basin, northwestern Colorado
[DE81-028665] N82-15690
Evaluation of infrared simulation data
[AD-A105872] N82-15931

URANIUM
Fuel-performance-improvement program
[DE81-029817] N82-15218

URANIUM COMPOUNDS
Effects of tensile deformation on the strain memory behavior of uranium-niobium alpha double prime martensite
[DE81-030285] N82-15184

URBAN DEVELOPMENT
Community noise assessment manual: Social survey workbook
[PB81-244360] N82-15835

URBAN PLANNING
Research in urban planning during the 70's — Netherlands
[TNO-80/PS/206] N82-16015

URBAN RESEARCH
Practical demonstration of urban air quality simulation models. Part 1: A report of the NATO/CCMS pilot study on air pollution assessment methodology and modeling
[PB81-242240] N82-15630
Manual for development of format for the presentation of Community Noise Assessment data
[PB81-243008] N82-15634
Research in urban planning during the 70's — Netherlands
[TNO-80/PS/206] N82-16015

URBAN TRANSPORTATION
Transit planning and management
[PB81-238032] N82-16017

USER MANUALS (COMPUTER PROGRAMS)
Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards
[NASA-CP-2196] N82-15095
User's guide: Computer Program for Three-dimensional Analysis of Building Systems (CTABS80)
[AD-A105513] N82-15241
NASTRAN user's guide (Level 17.5)
[NASA-CR-3146] N82-15456
Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] N82-15492
Community noise assessment manual: Computer programs for the Strategy Guidelines for Developing a Community Noise Control Program
[PB81-243024] N82-15641
EDITEX: A telex text-editor based on an 8085 microprocessor
[PHL-1980-06] N82-15795
Advanced Gamma Scan System Software package reference manual
[DE81-028094] N82-15819
Automatic calculation of spheroelliptical systems, essential facts, and elementary traces (cassette): Utilization
[LAS-OPT.INST-02-81] N82-15822

USER REQUIREMENTS
Development of Integrated Programs for Aerospace-Vehicle Design (IPAD) - IPAD user requirements
[NASA-CR-2985] N82-15034
Office of Space Terrestrial Applications (OSTA)/Applications Data Service (ADS) data systems standards
[NASA-CP-2196] N82-15095
OSTA data systems planning workshop recommendations N82-15096

OSTA/ADS standards development process
N82-15098
Panel A report: Standards needed to interconnect ADS pilots for data sharing for catalogues, directories, and dictionaries N82-15101
Panel B report: Standards needed to interconnect ADS pilots for data sharing for user interfaces
N82-15102
Panel C report: Standards needed for the use of ISO Open Systems Interconnection - basic reference model N82-15103
Teaching audience analysis to the technical student N82-15895
Analysis of responses to survey of DTIC's military users on current and planned technical library/information center automation
[AD-A105507] N82-15999
A Workshop on Qualitative Information Retrieval
[AD-A105887] N82-16000

V

VACUUM
Algorithms developed to obtain particular numerical solutions to the ideal MHD equilibrium problem
[DE81-028891] N82-15955

VACUUM FURNACES
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15088

VALIDITY
DECSYSTEM-20, model 2060, COBOL-74, version 12B
[PB81-233963] N82-15803
DECSYSTEM-10, model 1090-SMP COBOL-74, version 12B
[PB81-233975] N82-15804

VAPOR DEPOSITION
Chemical modification of semiconductor surfaces
[NASA-CR-165066] N82-15140
Development of a thin film preparation technique for ZrO2(Y2O3) electrolytes on porous support structures
[BMFT-FB-T-81-143] N82-15307
Passive components for high temperature operation N82-15314
Development of gas phase metallized plaques for electrodes of storage batteries, in particular for nickel oxide electrodes
[BMFT-FB-T-81-053] N82-15585

VAPORIZING
Vaporization and chemical transport under coal gasification conditions
[PB81-245839] N82-15165

VAPORS
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] N82-15602

VARIABILITY
Prediction and control of field swell pressures of compacted medium plastic clay
[PB81-242471] N82-15264
Cloud-encounter and particle-concentration variabilities from GASP data
[NASA-TP-1886] N82-15677

VARIATIONAL PRINCIPLES
Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

VECTOR ANALYSIS
Optical implementation of systolic array processing
N82-15899
Matrix vector multiplier with time varying single dimensional spatial light modulators N82-15900
Incoherent optical matrix-matrix multiplier
N82-15901
Iterative optical vector-matrix processors (survey of selected achievable operations) N82-15904

VECTOR SPACES
NOSS-SCAT wind direction alias removal
[NASA-CR-165069] N82-15680

VEGETATION
Remote sensing in forestry: Application to the Amazon region
[E82-10012] N82-15490

VELOCITY DISTRIBUTION
Calculation of unstarted-choked regime of supersonic and transonic compressor cascades
N82-15364
The instruments of the plasma experiment onboard the HELIOS solar probe
[BMFT-FB-W-81-015] N82-16034

VELOCITY MEASUREMENT
Time-resolved wave profile measurements in copper to Megabar pressures
[DE81-026109] N82-15373
Free-surface velocity measurements of plates driven by reacting and detonating RX-03-BB and PBX-0404
[DE81-026776] N82-15466

VENTILATION
Indoor air quality
[DE81-029857] N82-15611

VENUS ATMOSPHERE
Packaging techniques for low-altitude Venus balloons beacon N82-15336

VENUS PROBES
Packaging techniques for low-altitude Venus balloons beacon N82-15336

VERTICAL DISTRIBUTION
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705

VERTIGO
Flight illusions N82-15745

VESTIBULAR TESTS
Validation of predictive tests and countermeasures for space motion sickness N82-15719

VIBRATION
Human body reaction to vibration N82-15743

VIBRATION DAMPING
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165057] N82-15032
Damping for turbomachine blade variations in subsonic flow N82-15048
Using the envelope of resonance peaks to estimate power absorbed by a finite structure — vibration
[ISVR-TR-115] N82-15472
Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-006] N82-15851

VIBRATION EFFECTS
The effect of aspect ratio on the unsteady aerodynamic forces induced by vibration of a cascade blade N82-15063
Vertical motion of highway bridge structure due to an earthquake
[PB81-235319] N82-15254

VIBRATION MEASUREMENT
A method for force determination from vibration response measurements — application to turbomachine blades N82-15055
Practical experience with a noncontact blade vibration measuring system in industrial turbocompressors — vibration mode identification
N82-15065
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium N82-15070

VIBRATION MODE
Stability analysis of the twin mode model of coupled flexion/torsion vibrations in turbofans N82-15057
Practical experience with a noncontact blade vibration measuring system in industrial turbocompressors — vibration mode identification
N82-15065
Using the envelope of resonance peaks to estimate power absorbed by a finite structure — vibration
[ISVR-TR-115] N82-15472

VIBRATIONAL SPECTRA
Control of vibration in aeroelastic cascade experiments N82-15056
Noble gas halogen laser induced fluorescence of benzene: Some of its derivatives, difluoromethyl radicals; and carbon monoxide
[MPIS-22/1980] N82-15446

VIDEO DATA
Digital recording of video signals on magnetic tape at 40 M bit/sec
[BMFT-FB-T-81-084] N82-15410

VIDEO EQUIPMENT
Technology related investigations of hardware variations depending on system proposals and new approaches to decoders for Videotext-Bildschirmtext
[BMFT-FB-T-81-024] N82-15781

VIEW EFFECTS
Theoretical study of image spots with the wide field camera and the implications for nebular spectrography — computer program that traces spot diagrams
[LAS-OPT.INST-03-81] N82-15936

VIKING LANDER 2
Viking lander imaging investigation during extended and continuation automatic missions. Volume 2: Lander 2 picture catalog of experiment data record
[NASA-RP-1068-VOL-2] N82-16028

VIKING MARS PROGRAM
Viking lander imaging investigation during extended and continuation automatic missions. Volume 2: Lander 2 picture catalog of experiment data record
[NASA-RP-1068-VOL-2] N82-16028

VIRGINIA
An automated technique for estimating daily precipitation over the State of Virginia
[NASA-CR-156883] N82-15678

VIRUSES
Conference on plant virology N82-15767

VISCOELASTICITY
Thermomechanical response of Gr/Pi composites
[NASA-CR-165753] N82-15124

VISCOSITY
Heating oils, 1981
[DE81-030833] N82-15223
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359

VISCOUS FLOW
Influence of precursor heating on viscous flow around a Jovian entry body
[NASA-CR-3174] N82-15361

VISIBILITY
Meteorological and oceanographic observations on board Netherlands lightvessels and the lightplatform 'Goeree' in the North Sea
[KNMI-141-28] N82-15684
The optical recognition of surface targets as a function of surrounding, target and observation parameters in air to surface observations
[BMVG-FBWT-81-8] N82-15929
The optical recognition of sea targets as a function of surrounding and observation parameters in air to water observations
[BMVG-FBWT-81-10] N82-15930

VISUAL DISCRIMINATION
Survey of the observer's performance with remotely piloted vehicles — on target recognition
[BMVG-FBWT-81-3] N82-15036
Visual problems in aviation and space navigation
N82-15758

VISUAL OBSERVATION
The optical recognition of surface targets as a function of surrounding, target and observation parameters in air to surface observations
[BMVG-FBWT-81-8] N82-15929

VISUAL PERCEPTION
Flight illusions N82-15745
Visual problems in aviation and space navigation
N82-15758

VOCODERS
Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15286

VOICE COMMUNICATION
NASA aviation safety reporting system
[NASA-TM-81274] N82-15025

VOICE DATA PROCESSING
Digital speech transmission at low bitrates
[BMFT-FB-T-81-112] N82-15286

VOIDS
Effect of cyclic pulsed temperature on void growth in metals during irradiation
[DE81-030112] N82-15188

VOLATILITY
Predictive calculations of volatilities of metals and oxides in steam containing environments
[DE81-029638] N82-15186

VOLCANOLOGY
Preliminary analysis of gravity and aeromagnetic surveys of the Timber Mountain area, southern Nevada
[DE81-029462] N82-15506

VOLT-AMPERE CHARACTERISTICS
Derivative measurement system for current-voltage and light-current-voltage characteristics — of double-heterostructure lasers
[FTZ-FI-512-TBR-6] N82-15293

VOLTAGE AMPLIFIERS
Improved technique to measure electronically AC losses in superconducting cables
[DE81-028323] N82-15338

VORTEX BREAKDOWN
A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031

VORTICES
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067

VOYAGER 1 SPACECRAFT
Voyager 1 encounters Saturn
[NASA-TM-84078] N82-16030

W

WAFERS
Improvements of proximity exposure technique for smaller large-scale integration pattern
[BMFT-FB-T-81-072] N82-15411
Electron radiation system for structure production. Part 2: Equipment systems and design
[BMFT-FB-T-81-091-VOL-2] N82-15414

WAGE SURVEYS
Individual biomass facility reports. Supplement to some employment and earnings implications of regional biomass energy utilization: New England and the Cornbelt States
[DE81-028523] N82-15550

WARNING SYSTEMS
Detection of obstacles by low flying aircraft — using CO2 laser; mathematical model
[FOA-C-30227-E1] N82-15026

WASHING
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514

WASTE DISPOSAL
Engineering handbook for hazardous waste incineration
[PB81-248163] N82-15636
Assessment report on the effects of waste dumping in 106-mile ocean waste disposal site: Dumpsite evaluation report
[PB81-241572] N82-15650
Space navigation life quarantees N82-15759
Cabin pollution N82-15760
Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891

WASTE ENERGY UTILIZATION
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] N82-15367

WASTE TREATMENT
Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980
[PB81-244808] N82-15616
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236481] N82-15645
Improving municipal and industrial waste treatment processes: Nutritional and physical conditions that regulate floc formation in bacteria isolated from activated sludge
[PB81-246282] N82-16018

WASTE UTILIZATION
Recovery of raw materials by pyrolysis
[BMFT-FB-T-81-017] N82-15141
Recycling plant for paint sludges
[BMFT-FB-T-81-125] N82-15203
Waste plastic recycling information exchange. Volume 1: Summary report
[PB81-242273] N82-15255
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] N82-15652

WASTE WATER
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-236578] N82-15148

WATER
Investigation by means of laser magnetic resonance of the OH/HO2 reaction yielding H2O/O2
[MPIS-18A/1980] N82-15161
Development of the aluminum-air battery for electric vehicle applications
[DE81-028446] N82-16010

WATER CURRENTS
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380

WATER EROSION
Great Lakes coastal geology. Effects of jetties, Sodus Bay, New York
[PB81-238982] N82-156J2

WATER FLOW
Experimental design and data of the August 1980 Corral Gulch nocturnal wind experiment, Piceance Basin, northwestern Colorado
[DE81-028665] N82-15690

WATER HEATING
Moorhead district heating, phase 2
[DE81-029689] N82-15556

WATER LOSS
Caisson disease N82-15749

WATER MANAGEMENT
Research programme 1981/82 — water science N82-15474
Activities and Accounts report — water science research N82-15475
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481
Development of a simple water pump driven with solar energy
[BMFT-FB-T-81-119] N82-15533

WATER POLLUTION
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] N82-15624
Performance testing of the Soviet oil/debris skimmer
[PB81-244790] N82-15644
Assessment report on the effects of waste dumping in 106-mile ocean waste disposal site: Dumpsite evaluation report
[PB81-241572] N82-15650

WATER QUALITY
Activities and Accounts report — water science research N82-15475
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515
Water Resources Data for Wisconsin, water year 1980
[PB81-235186] N82-15516
Water resources data for Idaho, water year 1980. Volume 1: Great Basin and Snake River Basin above King Hill
[PB81-244188] N82-15517
Water resources data for Idaho, water year 1980. Volume 2: Upper Columbia River Basin and Snake River Basin below King Hill
[PB81-244196] N82-15518
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] N82-15624

WATER RESOURCES
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515
Water resources data for Idaho, water year 1980. Volume 1: Great Basin and Snake River Basin above King Hill
[PB81-244188] N82-15517
Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703

WATER TEMPERATURE
Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029880] N82-15507
Water Resources Data for Connecticut, water year 1980
[PB81-245292] N82-15515

WATER TREATMENT
Chemistry and application of ozone and ozone/UV light for water reuse
[PB81-236578] N82-15148
Research programme 1981/82 — water science N82-15474
Water resources data for Idaho, water year 1980. Volume 2: Upper Columbia River Basin and Snake River Basin below King Hill
[PB81-244196] N82-15518
Proceedings: Symposium on Iron and Steel Pollution Abatement Technology for 1980
[PB81-244808] N82-15616
Disequilibrium of hydrogen sulfide in ground water by aeration
[PB81-244717] N82-15628
Laboratory demonstration of the feasibility of using commercially-available, in-depth filters for suspended solids removal by cross-flow filtration
[PB81-243719] N82-15649

WATER WAVES
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706

WATERSHEDS
Remote sensing applications to resource problems in South Dakota
[E82-10002] N82-15481

WATERWAVE ENERGY CONVERSION
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] N82-15580

WAVE ATTENUATION
Wave attenuation and wave set up on a coastal reef
[PB81-246159] N82-15706
LH wave absorption by mode conversion near ion cyclotron harmonics
[DE81-029434] N82-15947

WAVE FRONT RECONSTRUCTION
Multifacet holographic optical elements N82-15920

WAVE FUNCTIONS
Exclusive processes in quantum chromodynamics
[DE81-028233] N82-15151

WAVE INTERACTION
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15380

WAVE PROPAGATION
Propagation effects handbook for satellite systems design: A summary of propagation impairments on 10 to 100 GHz satellite links with techniques for system design
[NASA-RP-1082] N82-15270
An overview of several rain and attenuation models N82-15272
Propagation data bases N82-15274
Prediction techniques N82-15275
Application of propagation predictions to Earth/space telecommunications system design N82-15276
Dynamic shear-wave velocity measurements using interferometric techniques
[DE81-026973] N82-15467
An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15660
Water waves generated by three dimensional bed motion: Abstract
[PB81-238172] N82-15674

WAVE SCATTERING
Plane-wave scattering-matrix theory of antennas and antenna-antenna interactions
[PB81-245243] N82-15356
Complexity of short period P seismograms: What does scattering contribute?
[AWRE-O-3/81] N82-15853

WAVEFORMS
A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data
[NASA-CR-156882] N82-15488

WAVEGUIDES
Constance mirror program: Progress and plans
[NASA-CR-164804] N82-15942

WEAK INTERACTIONS (FIELD THEORY)
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877

WEAPONS
Electromagnetic launcher: A new weapon
[DE81-029979] N82-15287

WEAR
Elucidation of wear mechanisms by ferrdgraphic analysis
[NASA-TM-82737] N82-15199

WEAR TESTS
Elucidation of wear mechanisms by ferrographic analysis
[NASA-TM-82737] N82-15199

WEATHER
Yearbook A Meteorology volume 132
[KNMI-97-132] N82-15682
Synoptic and upper air observations in the Netherlands, volume 24
[KNMI-142-24] N82-15685
Synoptic and upper air observations in the Netherlands, volume 25
[KNMI-142-25] N82-15686

WEATHER FORECASTING
The behavior of surface wind and thermodynamic fields in the presence of deep convection
[AD-A105895] N82-15687
National Hurricane operations plan
[PB81-247231] N82-15697

WEATHER STATIONS
Reports from the German Meteorological Service. Number 155: Two hundred years of meteorological observations at Hohenpeissenberg (1781-1980)
[ISSN-0072-4130] N82-15675

WEIBULL DENSITY FUNCTIONS
Tabular aids for fitting Weibull moment estimates
[AD-A105965] N82-15842

WEIGHT (MASS)
Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587

WEIGHT INDICATORS
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

WEIGHT REDUCTION
High temperature (Al2O3) insulation and light weight conductors N82-15337

WEIGHTLESSNESS
Investigations on the influence of gravity on joining processes with liquid melts, and of brazing and welding experiments under weightlessness
[BMFT-FB-W-81-024] N82-15093
A compendium of hypokinetic and hypodynamic animal studies
[NASA-CR-3485] N82-15709
The effects of rotation and oscillation: Aerial sickness N82-15744
Man's adaptation to weightlessness and low weight N82-15746

WELD STRENGTH
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-160(1981)] N82-15469

WELD TESTS
Evaluation of shielded metal arc and flux cored metal arc welding consumables for fabrication of stainless steel magnet cases for 4K service
[DE81-028651] N82-15449

WELDED JOINTS
Interfacial structures in nickel-based transition joints after long term service
[DE81-903971] N82-15155
On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-83] N82-15448
Influence of throat and plate thickness on the fatigue strength of fillet welds
[LBF-FB-131] N82-15457
Effect of gas pores from shop-primed plate material on the fatigue strength of longitudinal fillet welds
[LBF-FB-160(1981)] N82-15469

WELDING
COST 50: Materials for gas turbines N82-15071

WETLANDS
A proposal for continuation of support for the application of remotely sensed data to state and regional problems. Part 1: Technical proposal
[E82-10018] N82-15496
Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703

WETTABILITY
The role of the wettability for the production of composite materials in space: Quantities, influences and models
[BMFT-FB-W-81-021] N82-15094

WHEAT
Wheat cultivation: Identification and estimation of areas using LANDSAT data
[E82-10007] N82-15485
Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] N82-15492
US/Canada wheat and barley crop calender exploratory experiment implementation plan
[E82-10016] N82-15494

WHISKERS (CRYSTALS)
A study of the unipolar arcing damage mechanism on selected conductors and semiconductors
[AD-A105791] N82-15965

WHISTLERS
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067

WHITE LIGHT HOLOGRAPHY
E-beam generated holographic masks for optical vector-matrix multiplication N82-15919

WIDEBAND COMMUNICATION
System concepts and basic technologies for receiver components of digital radio link systems at 20 GHz
[BMFT-FB-T-81-166] N82-15281

WIDTH
Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-9] N82-15458

WIGGLER MAGNETS
Status of the free-electron laser experiment at Los Alamos
[DE81-030132] N82-15441

WILDERNESS
Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482

WIND DIRECTION
NOSS-SCAT wind direction alias removal
[NASA-CR-165069] N82-15680

WIND MEASUREMENT
Experimental design and data of the August 1980 Corral Gulch nocturnal wind experiment, Piceance Basin, northwestern Colorado
[DE81-028665] N82-15690

WIND PRESSURE
Experimental and theoretical study of a tall building subjected to wind loading
[DE81-029478] N82-15465

WIND PROFILES
One and two dimensional modeling of the planetary boundary layer
[MITT-29] N82-15668

WIND TUNNEL APPARATUS
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

WIND TUNNEL TESTS
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359

WIND VARIATIONS
NOSS-SCAT wind direction alias removal
[NASA-CR-165069] N82-15680

WIND VELOCITY
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15580
Climatology of high damaging wind in Illinois
[PB81-234767] N82-15683

WINDING
Steady-state heat transfer to boiling liquid helium in simulated coil windings
[DE81-029561] N82-15371

WINDOWS (APERTURES)
A study of methods of prediction and measurement of the transmission sound through the walls of light aircraft
[NASA-CR-165040] N82-15848

WINDPOWER UTILIZATION
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15580

WINDPOWERED GENERATORS
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] N82-15580

WING LOADING
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

WING OSCILLATIONS
A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031

WING SPAN
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

WINTER
Winterkill indicator model, Crop Condition Assessment Division (CCAD) data base interface driver, user's manual
[E82-10014] N82-15492

WIRE
Testing results of MF-Nbsub3Sn
[DE81-028632] N82-15135
Comparison of hydrostatic extrusion versus wire drawing as a method of producing Nbsub3Sn superconducting wire
[DE81-030275] N82-15251
Superconducting current densities in bronze-processed Nb3Sn multifilamentary wires
[DE81-030566] N82-15344

WISCONSIN
Water Resources Data for Wisconsin, water year 1980
[PB81-235186] N82-15516

WOOD
Thermochemical production of liquids from biomass
[DE81-030085] N82-15226
Downed dead woody fuel and biomass in the Northern Rocky Mountains
[PB81-240517] N82-15587
Assessment methodology for the air quality impact of residential wood burning
[DE81-029373] N82-15606
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] N82-15613
Proceedings of the conference on wood combustion environmental assessment
[PB81-248155] N82-15622

WORKING FLUIDS
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] N82-15537

WORMS
Utilization of earthworms and microorganisms in stabilization, decontamination and detoxification of residual sludges from treatment of wastewater
[PB81-236481] N82-15645

WYOMING
Geologic applications of thermal-inertia mapping from satellite — Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489

X

X RAY ANALYSIS
X-ray methods for the chemical characterization of atmospheric aerosols
[DE81-028874] N82-15603
X RAY FLUORESCENCE
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029822] N82-15772
X RAY IMAGERY
High resolution X-ray imager
[BMFT-FB-W-81-042] N82-15928
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933
X RAY INSPECTION
X-ray microscopy using grazing incidence reflection optics
[DE81-028160] N82-15933
X RAY IRRADIATION
Low-energy X-ray emission from light ion targets
[DE81-028249] N82-15855
X RAY SCATTERING
Small-angle X-ray scattering system with linear position-sensitive detector
[DE81-021920] N82-15967
X RAY SOURCES
Systems background in X-ray microanalysis
[DE81-027285] N82-15420
Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15961
X RAY SPECTROSCOPY
Hyper-filter-fluorescer spectrometer for fusion X-ray diagnostics
[DE81-029667] N82-15425
X RAY TELESCOPES
ROBISAT: Concept and feasibility study, phase A
[BMFT-FB-W-80-033] N82-15108
High resolution X-ray imager
[BMFT-FB-W-81-042] N82-15928
X RAYS
Applications of bent cylindrical mirrors to X-ray beamlines
[DE81-029918] N82-15936
XYLOSE
The conversion of agricultural by-products to sugars
[PB81-241432] N82-15588

Y

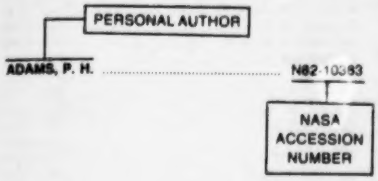
YELLOWSTONE NATIONAL PARK (ID-MT-WY)
Geologic applications of thermal-inertia mapping from satellite — Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] N82-15489
YIELD STRENGTH
Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461
YTTRIUM
Recent results on the gettering of tritium from molten lithium
[DE81-028214] N82-15177

Z

ZETA PINCH
Ultra-high-density plasma experiments: MHD simulations
[DE81-030244] N82-15954
ZINC ALLOYS
The 2-4-52 chalcopyrites for high speed devices
[AD-A106107] N82-15962
Small-angle X-ray scattering system with linear position-sensitive detector
[DE81-021920] N82-15967
ZIRCONATES
Effects of ion implantation on the photoferroelectric properties of lead lanthanum zirconate titanate ceramics
[DE81-026386] N82-15209

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

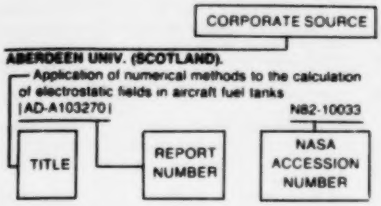
CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing



CORPORATE SOURCE
ABERDEEN UNIV. (SCOTLAND).
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks
[AD-A103270]
N82-10033
TITLE
REPORT NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACADEMY OF NATURAL SCIENCES, AVONDALE, PA.

Geographic analysis of thermal equilibria: A bioenergetic model for predicting thermal response of aquatic insect communities
[DE81-029860] N82-15507

AEG-TELEFUNKEN, BACKNANG (WEST GERMANY).

System concepts and basic technologies for receiver components of digital radio link systems at 20 GHz
[BMFT-FB-T-81-166] N82-15261

AEG-TELEFUNKEN, BERLIN (WEST GERMANY).

Improvement of tetrode power amplifier efficiency by adding harmonics to the carrier oscillation and energy savings resulting from volume-dependent Pulse-Duration Modulation (PDM) control
[BMFT-FT-T-81-163] N82-15309

AEG-TELEFUNKEN, FRANKFURT AM MAIN (WEST GERMANY).

Microanalysis by electron-spinning spectrometer for material and process control in semiconductor technology
[BMFT-FB-T-80-193] N82-15160

Optical triggering of power thyristors (3)
[BMFT-FB-T-81-071] N82-15298

Control of the minority carrier lifetime of silicon devices using electron irradiation
[BMFT-FB-T-81-037] N82-15349

AEG-TELEFUNKEN, HEILBRONN (WEST GERMANY).

Optoelectronics: Materials quality and device development
[BMFT-FB-T-81-093] N82-15926

AEROJET ELECTROSYSTEMS CO., AZUSA, CALIF.

Germanium accumulation-mode charge-injection-device process
[NASA-CR-166754] N82-15296

AGFA-GEVAERT A.G., MUNICH (WEST GERMANY).

Development of optical plastics
[BMFT-FB-T-81-121] N82-15927

AIR FORCE OFFICE OF SCIENTIFIC RESEARCH, BOLLING AFB, WASHINGTON, D.C.

Air Force research in optical processing N82-15895

AIR FORCE SYSTEMS COMMAND, WRIGHT-PATTERSON AFB, OHIO.

Meteorological satellites
[AD-A107427] N82-15110

Acta mechanica sinica (selected articles)
[AD-A108123] N82-15362

Generalized variational principles, variational principles and dual extremum principles of gasdynamics for the direct problem of turbomachine airfoil cascades on an arbitrary stream sheet of revolution N82-15363

Calculation of unstarted-choked regime of supersonic and transonic compressor cascades N82-15364

The numerical computation for diffraction and reflection of a traveling shock wave from an open end of a shock-tube N82-15365

Fundamentals of aeronautical and aerospace medical science
[AD-A102298] N82-15736

The developmental history of aeronautical and aerospace medical science N82-15737

Environmental conditions of aviation and space navigation N82-15738

General laws of aviation and space navigation environmental effects on the human body N82-15739

Medical problems of gravitational changes and powered flight N82-15740

Injury and protection of overweightness N82-15741

Harmfulness of violent impact and airflow shocks N82-15742

Human body reaction to vibration N82-15743

The effects of rotation and oscillation: Aerial sickness N82-15744

Flight illusions N82-15745

Man's adaptation to weightlessness and low weight N82-15746

Noise and sense of hearing N82-15747

The physiological effect of low-air-pressure anoxia N82-15748

Caisson disease N82-15749

Dangers of explosive decompression N82-15750

Oxygen toxication N82-15751

The relationship of body temperature to environmental temperature N82-15752

Comfortable temperature and tolerable temperature N82-15753

The physiological effect of heat and its prevention N82-15754

The effect of cold and the cold prevention N82-15755

Ionizing radiation and its biological effects N82-15756

Other biological effects of radiation N82-15757

Visual problems in aviation and space navigation N82-15758

Space navigation life quarantees N82-15759

Cabin pollution N82-15760

Aviation medical guarantees N82-15761

Space navigation medical guarantees and medical supervision N82-15762

AKADEMIYA NAUK SSSR, NOVOSIBIRSK.

Calculation of hydrodynamic interaction of the arbitrary profile cascades in the flow of ideal liquid N82-15043

Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow N82-15051

Calculation of nonstationary force ratios on blades of a rotating row in incompressible flow N82-15061

Aspects of acoustic resonance phenomena in turbomachines N82-15069

ALABAMA UNIV., BIRMINGHAM.

Improving municipal and industrial waste treatment processes: Nutritional and physical conditions that regulate floc formation in bacteria isolated from activated sludge
[PB81-246282] N82-16018

ALASKA UNIV., FAIRBANKS.

Cloud condensation nucleus counter by impactor sampling technique N82-15392

AMES LAB., IOWA.

Effect of applied stress on the transformation behavior of Ni-Ti
[DE81-029838] N82-15182

Some thermoelectric properties of the light rare earth sesquiselenides (R2Se/sub3-x/)
[DE81-025526] N82-15557

Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] N82-15579

APPLIED DECISION ANALYSIS, INC., MENLO PARK, CALIF.

Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] N82-16012

Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] N82-16013

ARGONNE NATIONAL LAB., ILL.

Computer simulation of bulk and surface chemical diffusion of light atoms in metals
[DE81-025159] N82-15175

Performance predictions of passive solar commercial buildings
[DE81-027979] N82-15247

Determination of nuclear-matter temperature and density
[DE81-023847] N82-15865

ARIZONA UNIV., TUCSON.

Passive components for high temperature operation N82-15314

Spectroscopic observations of comets
[NASA-CR-165077] N82-16029

Comets: Gases, ices, grains and plasma
[NASA-CR-165073] N82-16031

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.

CO2 laser waveguiding in proton implanted GaAs N82-15912

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, ST. LOUIS, MO.

Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039

ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.

Analysis of methodologies used for the assessment of wetland values
[PB81-245664] N82-15703

ASSESSMENT SYSTEMS CORP., ST. PAUL, MINN.

Methods for linking item parameters
[AD-A105509] N82-15779

ASTRO RESEARCH CORP., CARPINTERIA, CALIF.

Lightweight moving radiators for heat rejection in space
[NASA-CR-161943] N82-15366

ATOMIC WEAPONS RESEARCH ESTABLISHMENT, ALDERMASTON (ENGLAND).

Complexity of short period P seismograms: What does scattering contribute?
[AWRE-O-3/81] N82-15653

AXIOMATIX, LOS ANGELES, CALIF.
Engineering evaluations and studies. Report for IUS studies
[NASA-CR-167459] N82-15114

B

BATTELLE COLUMBUS LABS., MOUNTAIN VIEW, CALIF.
NASA aviation safety reporting system
[NASA-TM-81274] N82-15025

BATTELLE COLUMBUS LABS., OHIO.
Use of coal cleaning for compliance with SO2 emission regulations
[PB81-247520] N82-15618
Applications of electro-optic gratings in integrated optical signal processing devices N82-15910
Evaporated As2S3 Luneburg lenses for LiNbO3:Ti optical waveguides N82-15914

BATTELLE INST., FRANKFURT AM MAIN (WEST GERMANY).
Internal convection under low gravity due to orthogonal gradients of temperature and concentration
[BMFT-FB-W-81-041] N82-15069
Development of a cadmium selenide thin film solar cell
[BMFT-FB-T-81-109] N82-15535
Implementation and application of a set theoretical data base system
[BMFT-FB-DV-81-004] N82-15797

BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
Sputter deposition with nearly-parallel coating flux
[DE81-030107] N82-15176
Fuel-performance-improvement program
[DE81-029817] N82-15218
Thermochemical production of liquids from biomass
[DE81-030065] N82-15226
Analysis of column tracer experiments by a stochastic-convective transport method
[DE81-030088] N82-15375
Reservoir stability studies
[DE81-030099] N82-15510
Compressed-air energy-storage technology: Program overview
[DE81-030103] N82-15548
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] N82-15598
Evaluation of the usefulness of ecological simulation models in power plant impact assessment
[PNL-SA-9098] N82-15599
Speciation of aqueous contaminants - role of the geochemical model
[DE81-029976] N82-15600
Technique for planning and managing industrial growth from the air-quality standpoint
[DE81-028342] N82-15614
Comparison of computer codes (CE-THERM, FRAP-T5, GT3-FLECHT, and TRUMP-FLECHT) with data from the NRU-LOCA thermal hydraulic tests
[DE81-028136] N82-15817
Advanced Gamma Scan System Software package reference manual
[DE81-028094] N82-15819
Continuum electron emission in heavy ion: Atom collisons
[DE81-028234] N82-15860
Factors affecting criticality for spent-fuel materials in a geologic setting
[DE81-029275] N82-15891
Data editing on large data sets
[DE81-028022] N82-16002
Summary of the Graphic Information Display Session
[DE81-028231] N82-16003
Self-describing data file structure for large data sets
[DE81-027997] N82-16004

BELGRADE UNIV. (YUGOSLAVIA).
Oxidation of formic acid and methanol on single crystal platinum electrodes
[DE81-028330] N82-15154

BIOTECHNOLOGY, INC., ARLINGTON, VA.
USSR Space Life Sciences Digest
[NASA-TM-84080] N82-15708

BOEING CO., SEATTLE, WASH.
Selected advanced aerodynamic and active control concepts development
[NASA-CR-3220] N82-15033

BOEING COMMERCIAL AIRPLANE CO., SEATTLE, WASH.

Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 2: Knowledge base
[AD-A106103] N82-15285
Application of symbolic processing to command and control: An Advanced Information Presentation System. Volume 3: Program source files
[AD-A106104] N82-15286

BONN UNIV. (WEST GERMANY).
Thermospheric studies using satellites AEROS A and B
[BMFT-FB-W-81-012] N82-15667

BRIGHAM YOUNG UNIV., PROVO, UTAH.
The electrochemistry of molten lithium chlorate and its possible use with lithium in a battery
[AD-A105968] N82-15145

BRITISH AEROSPACE DYNAMICS GROUP, STEVENAGE (ENGLAND).
Electrothermal hydrazine thruster
[BAE-RPT/EHT/40212-VOL-1] N82-15118

BRITISH COLUMBIA UNIV., VANCOUVER.
Low temperature diffusion of positive muons in copper
[DE81-030255] N82-15973

BROOKHAVEN NATIONAL LAB., UPTON, N. Y.
Separation of hydrogen isotopes via single column pressure swing adsorption
[DE81-015658] N82-15149
Photothermal spectroscopy of aerosols
[DE81-026098] N82-15150
Interaction of stress with the martensitic phase transition in A15 compounds
[DE81-030527] N82-15178
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] N82-15220
Cryopumping of hydrogen and helium
[DE81-030553] N82-15246
Cycle design for the ISABELLE helium refrigerator
[DE81-030551] N82-15249
Analysis of cooldown performance for ISABELLE helium refrigerator
[DE81-030548] N82-15250
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] N82-15338
Superconducting current densities in bronze-processed Nb3Sn multifilamentary wires
[DE81-030566] N82-15344
Ultra-high-vacuum double-axis goniometer for use with an electron spectrometer
[DE81-028470] N82-15419
Multiparticle magnetic spectrometer with dE/dx and TRD particle identification
[DE81-030567] N82-15423
Production and use of high-grade silicon-diode temperature sensors
[DE81-030547] N82-15424
Role of large scale energy systems models in R&D planning
[DE81-026058] N82-15543
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] N82-15571
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] N82-15604
Assessment methodology for the air quality impact of residential wood burning
[DE81-029373] N82-15606
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] N82-15609
Applications of nuclear techniques for in vivo body composition studies at Brookhaven National Laboratory
[DE81-029922] N82-15772
Numerical studies of gauge field theories
[DE81-030526] N82-15846
Hypernuclei and interactions of kaons with nuclei
[DE81-028467] N82-15858
Coulomb explosion of large penetrating molecular clusters
[DE81-025866] N82-15861
Search for the violation of time-reversal invariance in K mu sub mu 3 decays
[DE81-030557] N82-15877
Polarizing multilayer spectrometer for neutrons
[DE81-029546] N82-15878
National synchrotron light source in the infrared region
[DE81-030037] N82-15932
Fine-grained hodoscopes based on scintillating optical fibers
[DE81-029316] N82-15935
Applications of bent cylindrical mirrors to X-ray beamlines
[DE81-029918] N82-15936
Design of 24.8-kW, 3.8 K cryogenic system for ISABELLE
[DE81-030555] N82-15949
Transient response of a thermal buffer: A study for ISABELLE
[DE81-030549] N82-15950
Heat-load measurement of prototype cryogenic magnets and leads for the ISABELLE project
[DE81-030550] N82-15951
MAGCOOL: The production cooling facility for ISABELLE magnets
[DE81-030554] N82-15952
Thermal conductivity measurements of insulators for fusion blankets
[DE81-030028] N82-15953
Slow positrons in the study of surface and near-surface defects
[DE81-030027] N82-15976
Phase transitions and variant actions in lattice gauge theory
[DE81-029324] N82-15977
Neutron scattering studies of quasi one- and two-dimensional hydrogen-bonded ferroelectrics
[DE81-030334] N82-15978
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] N82-16014

BROWN, BOVERI AND CO., LTD., BADEN (SWITZERLAND).
Control of vibration in aeroelastic cascade experiments N82-15056

BROWN UNIV., PROVIDENCE, R. I.
Estimate of the contribution of load transfer to the yield strength and hardness of a dual-phase steel
[DE81-025545] N82-15461

BUNDESANSTALT FUER MATERIALPRUEFUNG, BERLIN (WEST GERMANY).
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15066

BUREAU OF MINES, BOULDER CITY, NEV.
State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262

BUREAU OF MINES, TUSCALOOSA, ALA.
Effect of additives on sintering of silicon nitride-alumina-aluminum nitride compositions
[PB81-231096] N82-15214

BUREAU OF RADIOLOGICAL HEALTH, ROCKVILLE, MD.
Airborne ultrasound: Measurement and possible adverse effects
[PB81-240459] N82-15775

BUREAU OF THE CENSUS, WASHINGTON, D. C.
Fuels and electric energy consumed
[PB81-240442] N82-15594

BURNS AND ROE, INC., WOODBURY, N. Y.
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] N82-15527

BURR-BROWN RESEARCH CORP., TUCSON, ARIZ.
Minus 55 to plus 200 deg C 12 bit analog-to-digital converter N82-15327

C

CALIFORNIA STATE DEPT. OF TRANSPORTATION, SACRAMENTO.
Geologic hazards and their relation to planning, location, and design of transportation facilities
[PB81-235467] N82-16020

CALIFORNIA UNIV., BERKELEY.
Application of remote sensing to selected problems within the state of California
[E82-10004] N82-15482
Energetic particles flux experiment for ISEE mother/daughter spacecraft
[NASA-CR-166761] N82-16026

CALIFORNIA UNIV., BERKELEY. LAWRENCE BERKELEY LAB.
Alpha-spectroscopic techniques for field measurement of radon daughters

Numerical solution of a diffusion problem with segregation at a moving interface
[MC-NW-97/80] N82-15826

The construction of an accurate lower bound for the real parts of the eigen values of an M-matrix
[MC-NW-102/81] N82-15827

On the regularity of the principle value of the double layer potential
[MC-NW-104/81] N82-15828

On the choice of suitable operators and parameters in multigrid methods
[MC-NW-107/81] N82-15829

Surrogate duality relaxation for job shop scheduling
[MC-BW-145/81] N82-15835

Berry-Esseen theorems for simple linear rank statistics under the null-hypothesis
[MC-SW-71/81] N82-15840

Linear nonparametric tests for comparison of counting processes, with applications to censored survival data
[MC-SW-72/81] N82-15841

STOLLER (S. M.) ASSOCIATES, NEW YORK.

Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] N82-15553

STUTTGART UNIV. (WEST GERMANY).

Materials characterization of silicon and analysis of combination processes and impurities
[BMFT-FB-T-81-114] N82-15143

Heat transport and conduction layers in gravity-assisted heat pipes
[IKE-5-212] N82-15376

Space-resolved measurements of neutrons and ions emitted by a plasma focus
[IPF-80-8] N82-15940

A compilation of Rayleigh cross sections for the laser diagnostics of plasmas
[IPF-80-10] N82-15959

Energy analysis of fast ions from plasma focus discharges
[IPF-80-11] N82-15960

Relation between neutron production and instabilities in a plasma focus
[IPF-81-1] N82-15961

SULPHUR INST., WASHINGTON, D.C.

State-of-the art guideline manual for design, quality control and construction of Sulfur-Extended-Asphalt (SEA) pavements
[PB81-242547] N82-15262

SYDNEY UNIV. (AUSTRALIA).
Calibration and data correction procedures for flow meters and pressure transducers commonly used by the Coastal Studies Unit
[AD-A106884] N82-15418

SYRACUSE UNIV., N. Y.
A liquid crystal adaptive lens N82-15921

T

T. S. ASSOCIATES, INC., COLUMBIA, MD.
Laboratory demonstration of the feasibility of using commercially-available, in-depth filters for suspended solids removal by cross-flow filtration
[PB81-243719] N82-15649

TATA INST. OF FUNDAMENTAL RESEARCH, BOMBAY (INDIA).
Indian energy abstracts
[PB81-232316] N82-15591

TECHNICAL RESEARCH CENTRE OF FINLAND, ESPOO.
On the effects of the post-fabrication treatment methods for welded stainless steels
[VTT-83] N82-15448

TECHNISCHE HOCHSCHULE, AACHEN (WEST GERMANY).
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060
Microcomputer for attitude control systems
[BMFT-FB-W-81-040] N82-15112
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] N82-15134
Crosslinking of polyethylene in view of an application in wire coating
[BMFT-FB-T-81-058] N82-15211
Optimization of measurement signal processing and data acquisition for the laser twin focus velocimeter
[MITT-79-04] N82-15429

TECHNISCHE HOCHSCHULE, DARMSTADT (WEST GERMANY).
Technical and scientific research accompanying the projects on 'Needle Milling', including the determination of specific process parameters
[BMFT-FB-HA-81-005] N82-15447
The interactions of the HELIOS probe with the solar wind plasma
[BMFT-FB-W-81-036] N82-16036

TECHNISCHE HOCHSCHULE, VIENNA (AUSTRIA).
Preparation, implementation and evaluation of material science experiments under the SLN program TEXUS 2
[BMFT-FB-W-81-033] N82-15088

TECHNISCHE HOGESCHOOL, DELFT (NETHERLANDS).
On the efficiency of small air coil motors
[WTHD-131] N82-15303

TECHNISCHE UNIV., BERLIN (WEST GERMANY).
Experiments for the preparation of pure nonmetallic inorganic materials under space conditions
[BMFT-FB-W-81-014] N82-15086
Investigation on the applicability of slip casting for the production of cermets under microgravity conditions
[BMFT-FB-W-81-017] N82-15091
Introduction to the calculation of parametrically excited oscillations
[ISBN-3-7983-5150-3] N32-15294

TECHNISCHE UNIVERSITAET, BRUNSWICK (WEST GERMANY).
Analytical and numerical model experiments concerning the physics of rock salt formation
[GAMMA-38] N82-15979

TECHNISCHE UNIVERSITAET, HANOVER (WEST GERMANY).
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] N82-15367
Catalog of effective width and ultimate loads of longitudinally stiffened plates
[BMVG-FBWT-81-8] N82-15458
Noise reduction during the production of thick walled steel constructions by means of impact processing techniques
[BMFT-FB-HA-81-006] N82-15851

TECHNISCHE UNIVERSITAET, MUNICH (WEST GERMANY).
Investigations of micrometeorite impacts on large surfaces and during long-term missions
[TUM-RT-TB-80/12] N82-15090
Transparent GaAlAs luminescent diodes for optical wavelength multiplexing
[BMVG-FBWT-79-18] N82-15938

TEKNEKRON, INC., MCLEAN, VA.
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] N82-15514

TELEDYNE GEOTECHNICAL, ALEXANDRIA, VA.
An investigation of attenuation, scattering and site effects on regional phases
[AD-A105995] N82-15660

TELEDYNE WAH CHANG, ALBANY, N.Y.
Testing results of MF-Nbsub3Sn
[DE81-026632] N82-15135

TEMPLE UNIV., PHILADELPHIA, PA.
Experimental investigations in particle physics at intermediate energies
[DE81-027954] N82-15857

TENNESSEE UNIV., KNOXVILLE.
Continuum capture in the three-body problem
[DE81-025467] N82-15980

TENNESSEE UNIV., TULLAHOMA.
Aerodynamic analysis of cascaded airfoils in unsteady rotational flow N82-15044
Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067

TEXAS A&M UNIV., COLLEGE STATION.
Simulataneous wave and current forces on cylinder near the bottom boundary
[PB81-243990] N82-15360
Overpressured marine sediments. Volume 3: Thermal conductivity, electrical resistivity, and permeability of saturated sediment at various porosities
[PB81-243578] N82-15705
One and a half centered expansion for ion-atom collisions
[DE81-028142] N82-15873

TEXAS INSTRUMENTS, INC., DALLAS.
Fabrication and high temperature characteristics of ion-implanted GaAs bipolar transistors and ring-oscillators N82-15320

TEXAS TECHNOLOGICAL UNIV., LUBBOCK.
Reliability study of refractory gate gallium arsenide MESFETS N82-15324

TEXAS UNIV., AUSTIN.
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] N82-15225
Continuing development of the DEROB system
[DE81-027971] N82-15243
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] N82-15505
Kinetic theory of Alfven wave heating
[DE81-029777] N82-15582
Breakdown in the PRETEXT Tokamak
[DE81-029362] N82-15945

TEXAS UNIV. AT AUSTIN.
Salinity of deep formation waters, Texas Gulf Coast: Preliminary results
[DE81-029773] N82-15701

TEXTRON BELL HELICOPTER, FORT WORTH, TEX.
Helicopter landing gear design and test criteria investigation
[AD-A105512] N82-15035

THYSSEN GIESSEREI A.G., BOCHUM (WEST GERMANY).
Investigation concerning the production of turbine blades and vanes using high temperature high strength in-situ composites
[BMFT-FB-T-81-039] N82-15072

TOKYO UNIV. (JAPAN).
Aerodynamic response of a blade in pitching oscillation with partial and full seperation
N82-15047
Three-dimensional analysis of cascade flutter in parallel shear flow N82-15062
Inlet distortion and blade vibration in compressible flow between parallel walls N82-15066

TOSHIBA RESEARCH AND DEVELOPMENT CENTER, KAWASAKI (JAPAN).
Self excited flow oscillation in the low pressure steam turbine cascade N82-15049

TRANSPORTATION RESEARCH BOARD, WASHINGTON, D.C.
Transit planning and management
[PB81-238032] N82-16017
Highway safety appurtenances

WYOMING UNIV., LARAMIE.

Contribution to CCN Workshop report from University of Wyoming group N82-15384

Comparing dry aerosol size measurements N82-15407

X

XAVIER UNIV. OF LOUISIANA, NEW ORLEANS.

Solar radiation measurement project
[NASA-CR-165064] N82-16033

Y

YORK UNIV., DOWNSVIEW (ONTARIO).

Diffusion tube N82-15393

Z

ZEISS (CARL), OBERKOCHEN (WEST GERMANY).

Construction of a numerically controlled device for aligning optical and mechanical axis of a microscope lens on a lathe
[BMFT-FB-T-81-033] N82-15924

CONTRACT NUMBER INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 20 NUMBER 6

Typical Contract Number Index Listing

DEN3-224
N82-10495
CONTRACT NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

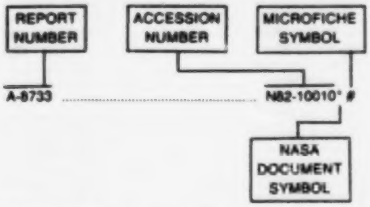
REPORT / ACCESSION NUMBER INDEX

Typical Report / Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley
COLORADO
University of Colorado, Boulder
DISTRICT OF COLUMBIA
Library of Congress
GEORGIA
Georgia Institute of Technology, Atlanta
ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge
MISSOURI
Linda Hall Library, Kansas City
NEW YORK
Columbia University, New York
OKLAHOMA
University of Oklahoma, Bizzell Library
PENNSYLVANIA
Carnegie Library of Pittsburgh
WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an * following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library
COLORADO
Denver Public Library
CONNECTICUT
Hartford Public Library
MARYLAND
Enoch Pratt Free Library, Baltimore
MASSACHUSETTS
Boston Public Library
MICHIGAN
Detroit Public Library
MINNESOTA
Minneapolis Public Library and Information Center
NEW JERSEY
Trenton Public Library

NEW YORK
Brooklyn Public Library
Buffalo and Erie County Public Library
Rochester Public Library
New York Public Library
OHIO
Akron Public Library
Cincinnati and Hamilton County Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcemen in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific an technical publications that might support aeronautics and space research and development. If yo have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE throug the usual contract- or grant-reporting channels), please send them for consideration to the NAS Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C. 20402, United States of America.

Semimonthly issues...

Annual subscription rates: $90.00 domestic; $112.00 foreign. Price per single copy: $4.75 domestic; $5.95 foreign.

Annual index issues...

Pricing based upon pagination.

Domestic subscription rates...

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates...

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 20, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Government Information Systems.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 31, 1982.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

SUBJECT SCOPE

Subject scope of *STAR*, and *IAA* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

HOW TO USE *STAR* SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche(1) are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Adminstration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its' Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($6.00 domestic; $12.00 foreign). Microfiche are sold at price code A01 ($4.00 domestic; $8.00 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;
2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF *STAR* ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue and other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $50.00 North America; $100.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 20 NUMBER 7/APRIL 8, 1982

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 863

02 AERODYNAMICS 863

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*

03 AIR TRANSPORTATION AND SAFETY 865

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 866

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 867

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 868

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 869

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 870

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 870

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*

12 ASTRONAUTICS (GENERAL) 872

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS N.A.

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) N.A.

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 877

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 877

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATION, COMMAND AND TRACKING 878

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 878

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 881

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 882

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) **882**
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS **882**
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY **884**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS **888**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **891**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS **894**
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics*.

31 ENGINEERING (GENERAL) **898**
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS **902**
Includes land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING **906**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuity.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER **909**
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY **911**
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS **914**
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING **916**
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY **918**
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS **918**
Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) **N.A.**

43 EARTH RESOURCES **920**
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION **926**
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION **937**
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS **947**
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY **951**
Includes weather forecasting and modification.

48 OCEANOGRAPHY **955**
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 957
Includes genetics.

52 AEROSPACE MEDICINE 962
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 964
Includes psychological factors; individual and group behavior· crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 965
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 966

60 COMPUTER OPERATIONS AND HARDWARE 966
Includes computer graphics and data processing.
For components see *33 Electronics and Electrical Engineering.*

61 COMPUTER PROGRAMMING AND SOFTWARE 967
Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 969
Includes computer networks.

63 CYBERNETICS 970
Includes feedback and control theory.
For related information see also *54 Man/System Technology and Life Support.*

64 NUMERICAL ANALYSIS 970
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 972
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 973
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS N.A.
Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also *Engineering.*

70 PHYSICS (GENERAL) 973
For geophysics see *46 Geophysics.* For astrophysics see *90 Astrophysics.* For solar physics see *92 Solar Physics.*

71 ACOUSTICS 974
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution.*

72 ATOMIC AND MOLECULAR PHYSICS 976

DEVELOPMENT AND EVALUATION OF AUTOMATIC LANDING CONTROL LAWS FOR LIGHT WING LOADING STOL AIRCRAFT

B. Feinreich, O. Degani, and G. Gevaert Jul. 1981 371 p refs

(Contract NAS2-9410)

(NASA-CR-166160) Avail: NTIS HC A16/MF A01 CSCL 01C

Automatic flare and decrab control laws were developed for NASA's experimental Twin Otter. This light wing loading STOL aircraft was equipped with direct lift control (DLC) wing spoilers to enhance flight path control. Automatic landing control laws that made use of the spoilers were developed, evaluated in a simulation and the results compared with these obtained for configurations that did not use DLC. The spoilers produced a significant improvement in performance. A simulation that could be operated faster than real time in order to provide statistical landing data for a large number of landings over a wide spectrum of disturbances in a short time was constructed and used in the evaluation and refinement of control law configurations. A longitudinal control law that had been previously developed and evaluated in flight was also simulated and its performance compared with that of the control laws developed. Runway alignment control laws were also defined, evaluated, and refined to result in a final recommended configuration. Good landing performance, compatible with Category 3 operation into STOL runways, was obtained.

PREDESIGN STUDY FOR A MODERN 4-BLADED ROTOR FOR THE NASA ROTOR SYSTEMS RESEARCH AIRCRAFT
H. E. Bishop, J. E. Burkam, R. C. Hemingway, C. N. Keys, K. E. Smith, J. H. Smith, and J. A. Staley Jan. 1981 312 p refs
(Contract NAS2-10689)
(NASA-CR-166153) Avail: NTIS HC A14/MF A01 CSCL 01B

Trade-off study results and the rationale for the final selection of an existing modern four-bladed rotor system that can be adapted for installation on the Rotor Systems Research Aircraft (RSRA) are reported. The results of the detailed integration studies, parameter change studies, and instrumentation studies and the recommended plan for development and qualification of the rotor system is also given. Its parameter variants, integration on the RSRA, and support of ground and flight test programs are also discussed. Author

N82-16043*# Hughes Helicopters, Culver City, Calif.
PRE-DESIGN STUDY FOR A MODERN FOUR-BLADED ROTOR FOR THE ROTOR SYSTEM RESEARCH AIRCRAFT (RSRA) Final Report
Charles W. Hughes and Andrew H. Logan Mar. 1981 140 p refs
(Contract NAS2-10690)
(NASA-CR-166154) Avail: NTIS HC A07/MF A01 CSCL 10A

Various candidate rotor systems were compared in an effort to select a modern four-bladed rotor for the RSRA. The YAH-64 rotor system was chosen as the candidate rotor system for further development for the RSRA. The process used to select the rotor system, studies conducted to mate the rotor with the RSRA and provide parametric variability, and the development plan which would be used to implement these studies are presented. Drawings are included. A.R.H.

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

CAS22 - FORTRAN PROGRAM FOR FAST DESIGN AND ANALYSIS OF SHOCK-FREE AIRFOIL CASCADES USING FICTITIOUS-GAS CONCEPT Final Report
Djordje S. Dulikravich and Helmut Sobieczky (DFVLR-Inst. fuer Theoretische Stroemungsmechanik, Goettingen, West Germany) Washington NASA Jan. 1982 59 p refs
(Contract NAS3-22532)
(NASA-CR-3507) Avail: NTIS HC A04/MF A01 CSCL 01A

A user-oriented computer program, CAS22, was developed that is applicable to aerodynamic analysis and transonic shock-free redesign of existing two-dimensional cascades of airfoils. This FORTRAN program can be used: (1) as an analysis code for full-potential, transonic, shocked or shock-free cascade flows; (2) as a design code for shock-free cascades that uses Sobieczky's fictitious-gas concept; and (3) as a shock-free design code followed automatically by the analysis in order to confirm that the newly obtained cascade shape provides for an entirely shock-free transonic flow field. A four-level boundary-conforming grid of an O type is generated. The shock-free design is performed by implementing Sobieczky's fictitious-gas concept of elliptic continuation from subsonic into supersonic flow domains. Recomputation inside each supersonic zone is performed by the method of characteristics in the rheograph plane by using isentropic gas relations. Besides converting existing cascade shapes with multiple shocked supersonic regions into shock-free cascades, CAS22 can also unchoke previously choked cascades and make them shock free. A.R.H.

N82-16045*# Pennsylvania State Univ., University Park. Applied Research Lab.
THE BOUNDARY LAYER ON COMPRESSOR CASCADE BLADES Semiannual Progress Report, 1 Jun. - 1 Dec. 1981
Steven Deutsch 1 Dec. 1981 19 p refs
(Grant NsG-3264)
(NASA-CR-165079) Avail: NTIS HC A02/MF A01 CSCL 01A

Some redesign of the cascade facility was necessary in order to incorporate the requirements of the LDA system into the design. Of particular importance was the intended use of a combination of suction upstream of the blade pack with diverging pack walls, as opposed to blade pack suction alone, for spanwise dimensionality control. An ARL blade was used to redo some tests using this arrangement. Preliminary testing and boundary layer measurements began on the double circular arc blades. A.R.H.

SUMMARY OF THEORETICAL CONSIDERATIONS AND WIND TUNNEL TESTS OF AN AERODYNAMIC SPOILER FOR STALL PROOFING A GENERAL AVIATION AIRPLANE

Howard L. Chevalier Jan. 1982 55 p refs
(Grant NsG-1407)
(NASA-CR-165100) Avail: NTIS HC A04/MF A01 CSCL 01A

An airplane stall proofing system utilizing a spoiler was investigated for application on a low wing airplane representative of typical general aviation aircraft. Tests of the full scale airplane were conducted in the NASA Langley 30 x 60 foot full scale wind tunnel. The test velocity was 86 feet per second, corresponding to a Reynolds number of 2.20 million. The stall proofing capability of the spoiler is shown and a theoretical approach to the design of the spoiler and analysis of the spoiler's contribution to the airplane's trim and longitudinal stability is verified. Controlled spoiler deployment in a narrow angle of attack range, 4 degrees, immediately preceding the stall angle will stall proof the airplane. The results also show some of the limitations of flight tests to determine spoiler deployment rate for good handling qualities. M.G.

CALCULATION OF THREE-DIMENSIONAL, INVISCID, SUPERSONIC, STEADY FLOWS Final Report

Gino Moretti Dec. 1981 120 p refs
(Grant NsG-1248)
(NASA-CR-165110; POLY/M/AE-81-25) Avail: NTIS HC A06/MF A01 CSCL 20D

A detailed description of a computational program for the evaluation of three dimensional supersonic, inviscid, steady flow past airplanes is presented. Emphasis was put on how a powerful, automatic mapping technique is coupled to the fluid mechanical analysis. Each of the three constituents of the analysis (body geometry, mapping technique, and gas dynamical effects) was carefully coded and described. Results of computations based on sample geometrics and discussions are also presented. M.D.K.

A UNIFIED THERMAL AND VERTICAL TRAJECTORY MODEL FOR THE PREDICTION OF HIGH ALTITUDE BALLOON PERFORMANCE Final Report

Leland A. Carlson and Walter J. Horn Jun. 1981 90 p refs
(Contract NAS6-3072)
(NASA-CR-156884; TAMRF-4217-81-01) Avail: NTIS HC A05/MF A01 CSCL 01A

A computer model for the prediction of the trajectory and thermal behavior of zero-pressure high altitude balloon was developed. In accord with flight data, the model permits radiative emission and absorption of the lifting gas and daytime gas temperatures above that of the balloon film. It also includes ballasting, venting, and valving. Predictions obtained with the model are compared with flight data from several flights and newly discovered features are discussed. Author

APPLICATION OF IMAGE PROCESSING TECHNIQUES TO FLUID FLOW DATA ANALYSIS

Charles C. Giamati 1981 16 p Presented at the 11th Ann. Computer Output Microfilm (COMtec) Conf., Lincolnshire, Ill., 24-26 Feb. 1981
(NASA-TM-82760; E-1081) Avail: NTIS HC A02/MF A01 CSCL 01A

The application of color coding techniques used in processing remote sensing imagery to analyze and display fluid flow data is discussed. A minicomputer based color film recording and color CRT display system is described. High quality, high resolution images of two-dimensional data are produced on the film recorder. Three dimensional data, in large volume, are used to generate color motion pictures in which time is used to represent the third dimension. Several applications and examples are presented. System hardware and software is described. M.G.

SOME EXPERIMENTAL INVESTIGATIONS ON TRANSONIC FLUTTER CHARACTERISTICS OF THIN PLATE WING MODELS WITH SWEPTBACK AND TAPERED TIPS

Eiichi Nakai Sep. 1981 49 p refs In JAPANESE; ENGLISH summary
(NAL-TR-682; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

Some experimental investigations on the transonic flutter characteristics were conducted using thin plate cantilevered wing models with sweptback tapered tips, which were elastically supported at the root, in the NAL 0.6m x 0.6m transonic blowdown wind tunnel for flutter testing in the range of Mach numbers from 0.804 to 1.171. The wing models have the tip planform of sweptback angles of 35 degrees at the leading edge and 30 degrees at 1/4 chord line, and an aspect ratio of 1.017 and a taper ratio of 0.6. It is concluded that the flutter boundaries of the wing models have been obtained and the boundaries expressed by the 'experimental flutter speed coefficient' are characterized as having minimum values at around Mach number 1.0. It is also concluded that the considerable increase in the flutter instability area is caused by the decrease in the stiffness of the elastic support at the root of the model. Author

A METHOD OF ESTIMATING UPWASH ANGLE AT NOSEBOOM-MOUNTED VANES Final Report

Kenneth Rawlings, III Jun. 1981 115 p refs
(AD-A106160; AFFTC-TIM-81-1) Avail: NTIS HC A06/MF A01 CSCL 20/4

This technical information memorandum documents a theoretically-based method of estimating the upwash angle at noseboom-mounted vanes of an arbitrary aircraft. The method is commonly called the Yaggy-Rogallo technique and has been used successfully for many years at the NASA/Dryden Flight Research Center (NASA/DFRC) and the Air Force Flight Test Center (AFFTC). The technique divides any aircraft into a collection of bodies of revolution and thin airfoils, makes upwash angle estimates for each component, and combines the individual estimates into a single estimate. Development of the theory for upwash angle estimates of both bodies of revolution and thin airfoils are presented. Recent improvements in solution and use of the Yaggy-Rogallo equations are also presented. Guidelines for using the upwash angle estimates in data reduction and analysis are presented along with comparisons to flight test upwash calibration data showing excellent results. FORTRAN V computer programs were written to simplify and expedite making upwash angle estimates. Listings of the program code, a user's guide, and a programmer's guide are included in the memorandum. THE ANALYSIS AND DESIGN OF TWO-ELEMENT AIRFOIL CONFIGURATION IN TRANSONIC FLOW Final Report, 19 May 1975 - 30 Aug. 1979

Giuseppe Volpe Oct. 1981 67 p refs
(Contract N00014-75-C-0722)
(AD-A107547; ONR-CR-215) Avail: NTIS HC A04/MF A01 CSCL 20/4

This report describes the development of numerical techniques for predicting the flow over two-element airfoil configurations, such as airfoils with a slat or a flap, at transonic speeds and for designing such airfoil systems. The effort was divided in three phases. The first phase involved the development of a method to compute the inviscid flow over these configurations. In the second phase the inviscid code was coupled to a boundary layer calculation program in order to compute the loss in performance due to viscous effects. In the third phase an inverse design code that constructs the airfoil system corresponding to a desired pressure distribution was developed. Author (GRA)

N82-16063# Grumman Aerospace Corp., Bethpage, N.Y.
NONLINEAR ANALYSIS OF INTERFERING BODIES IN SUPERSONIC FLOW Final Report, 17 Mar. 1980 - 16 May 1981
Frank Marconi Jul. 1981 63 p refs
(Contract F49620-80-C-0044; AF Proj. 2307)
(AD-A108071; RE-631; AFOSR-81-0771TR) Avail: NTIS HC A04/MF A01 CSCL 20/4

This report describes a study of the flow field about interfering bodies in a supersonic stream and is directed toward the prediction of supersonic store carriage/separation. The development of computational techniques aimed at producing a usable code is discussed. The code includes a characteristic based finite difference scheme to solve Euler's equations and a new and general shock fitting scheme. One problem uncovered during this first years effort is that of transition from a regular reflection to a Mach disc shock configuration. The basic finite difference scheme has been exercised extensively and was proven sound. More importantly the new shock fitting scheme is able to predict complex interactive shock patterns. GRA

03 AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; and aircraft accidents.

THE PREVALENCE OF VISUAL DEFICIENCIES AMONG 1979 GENERAL AVIATION ACCIDENT AIRMEN
J. R. Dille and C. F. Booze, Jr. Jul. 1981 10 p refs
(AD-A106489; FAA-AM-81-14) Avail: NTIS HC A02/MF A01 CSCL 01/2

Analyses of the accident experience of pilots who were monocular, did not meet (even the liberal) vision standards, had color vision defects and no operational restrictions, or wore contact lenses, have shown higher-than-expected accident experience in previous studies. However, no causal role had been assigned by accident investigators and reexamination of the records failed to show any obvious pattern or relationship between the defects and the accidents. In the present study of 1979 accidents, the relatively small number of pilots with aphakia and artificial lens implants, as well as the total eye pathology population, had significantly higher accident rates, but the monocular pilots did not. Again, no causal role had been ascribed. Some associations are debatable, but there is no clear recurring problem. There are still unresolved questions about the consistent operational performance of monocular pilots, those who are not fully corrected to 20/20 distant visual acuity bilaterally, airmen with near vision deficiencies only who are not required to wear corrective glasses, those without fusion, and several with appreciable pathology who have 20/20 corrected central visual acuity but about whom we know very little concerning their dynamic, peripheral, depth or accommodative function. Author (GRA)

TEST AND EVALUATION OF IMPROVED AIRCREW RESTRAINT SYSTEMS
G. T. Singley, III Sep. 1981 352 p refs
(DA Proj. 1L1-62209-AH-76)
(AD-A107576; USAAVRADCOM-TR-81-D-27) Avail: NTIS HC A16/MF A01 CSCL 01/3

US Army aviation accident data shows that a majority of all injuries in attack helicopters could have been avoided if these aircraft had been equipped with crashworthy seat and restraint systems. The compactness of the cockpit and the close proximity of mission equipment to the aircrew in attack and scout helicopters pose serious crash impact hazards. Although not desirable from a crashworthiness standpoint, operational considerations may dictate that mission equipment and structure be located within the occupant's crash impact motion envelope, particularly for his head. The cockpit can be delethalized further when the improved restraint is complemented by padding potential strike surfaces in the cockpit; making contact surfaces frangible; and providing weapon system sights with frangibility, telescoping, and/or swing-away features. This report presents the results of an effort to test and compare the potential of several aircrew restraint systems to reduce the crash impact motion envelope of helicopter aircrewmen. Author (GRA)

SPECIAL INVESTIGATION REPORT. SEARCH AND RESCUE PROCEDURES AND ARMING OF EMERGENCY LOCATOR TRANSMITTER: AIRCRAFT ACCIDENT NEAR MICHIGAN CITY, INDIANA, 7 DECEMBER, 1980
11 Aug. 1981 19 p
(PB81-249427; NTSB-SIR-81-2) Avail: NTIS HC A02/MF A01 CSCL 01B

A special investigation of the circumstances surrounding the crash of a Beechcraft E-90, near Michigan City, Indiana, on December 7, 1980 and of the search and rescue activities following the accident, and the associated operation of the aircraft's emergency locator transmitter (ELT) is presented. As a result of not following proper notification procedures, coordination oversights, and communicaton gaps, the search for the missing aircraft was significantly hampered. The actual crash site was not reached by search personnel until nearly 4 hours after the crash. Some or all of the aircraft's four occupants, who died of hypothermia, probably survived the original crash. Examination of the ELT switch revealed that it was in the OFF position. A rescue could have been effected if the proper authorities had been notified and given the aircraft's last known position. GRA

SPECTRALLY BALANCED CHROMATIC LANDING APPROACH LIGHTING SYSTEM Patent
Wendell D. Chase, inventor (to NASA) Issued 22 Sep. 1981 10 p Filed 10 Dec. 1976 Supersedes N77-12031 (15 - 03, p 0286)
(NASA-Case-ARC-10990-1; US-Patent-4,291,294;
US-Patent-Appl-SN-749420; US-Patent-Class-340-26;
US-Patent-Class-244-114R) Avail: US Patent and Trademark Office CSCL 17G

Red warning lights delineate the runway approach with additional blue lights juxtaposed with the red lights such that the red lights are chromatically balanced. The red/blue point light sources result in the phenomenon that the red lights appear in front of the blue lights with about one and one-half times the diameter of the blue. To a pilot observing these lights along a glide path, those red lights directly below appear to be nearer than the blue lights. For those lights farther away seen in perspective at oblique angles, the red lights appear to be in a position closer to the pilot and hence appear to be above the corresponding blue lights. This produces a very pronounced three dimensional effect referred to as chromostereopsis which provides valuable visual cues to enable the pilot to perceive his actual position above the ground and the actual distance to the runway. Official Gazette of the U.S. Patent and Trademark Office

TERMINAL AREA AUTOMATIC NAVIGATION, GUIDANCE, AND CONTROL RESEARCH USING THE MICROWAVE LANDING SYSTEM (MLS). PART 3: A COMPARISON OF WAYPOINT GUIDANCE ALGORITHMS FOR RNAV/MLS TRANSITION Final Report
Samuel Pines Washington NASA Jan. 1982 87 p refs
(Contract NAS1-15116)
(NASA-CR-3512; AMA-81-7) Avail: NTIS HC A05/MF A01 CSCL 17G

The results of an investigation carried out for the Langley Research Center Terminal Configured Vehicle Program are presented. The investigation generated and compared three path update algorithms designed to provide smooth transition for an aircraft guidance system from DME, VORTAC, and barometric navaids to the more precise MLS by modifying the desired 3-D flight path. The first, called the Zero Cross Track, eliminates the discontinuity in cross track and altitude error by designating the first valid MLS aircraft position as the desired first waypoint, while retaining all subsequent waypoints. The discontinuity in track angle is left unaltered. The second, called the Tangent Path also eliminates the discontinuity in cross track and altitude and choose a new desired heading to be tangent to the next oncoming circular arc turn. The third, called the Continued Track eliminates the discontinuity in cross track, altitude and track angle by accepting the current MLS position and track angle as the desired ones and recomputes the location of the next waypoint. A method is presented for providing a waypoint guidance path reconstruction which treats turns of less than, and greater than, 180 degrees in a uniform manner to construct the desired path. Author

N82-16061# Rome Air Development Center, Griffiss AFB, N.Y.
PASSIVE TRILATERATION POSITIONING PROCEDURE ERROR ANALYSIS
Dean C. Merchant Aug. 1981 25 p ref
(AF Proj. 4594)
(AD-A106690; RADC-TR-81-225) Avail: NTIS HC A02/MF A01 CSCL 17/7

This report presents the results of a conceptual and analytical study pertaining to the propagation of errors through a spatial trilateration network. The network consists of an aircraft, DME ground based units and an independent ground based tracker. The primary error sources treated are DME range errors, geodetic coordinate errors of the ground based DME units, timing errors and the 'Geodetic slice' between the local survey relating DME stations and the ground based tracker. The result is an algebraic tool for studying the influences of various system errors and geometry on the error in positioning an aircraft with respect to a ground based tracking unit. Author (GRA)

SIMULATOR EVALUATION OF ELECTRONIC RADIO AIDS TO NAVIGATION DISPLAYS. THE RA-2 EXPERIMENT Interim Report
R. B. Cooper, K. L. Marino, and W. R. Bertsche Jul. 1981 122 p
(Grant DOT-CG-835285-A)
(AD-A106672; EA-81-U-009; USCG-D-50-81) Avail: NTIS HC A06/MF A01 CSCL 17/7

The report describes a ship's bridge simulation evaluation of an electronic radio aids to navigation display for use by pilots in restricted waterways. The experiment known as RA-2 is the third in a series of experiments to trade off display information effectiveness with operational requirements and shipboard system cost. The RA-2 evaluation used a 'benchmark' true motion, trackup GRAPHIC display recommended in the previous experiment to conduct simulated poor visibility runs of a 30,000 dwt tanker around a 35-degree left bend in a 500-foot-wide channel. Experimental variables included two different navigation system noise levels which translated to random position errors of 16 and 32 meters RMS, and the use of an ALPHA-BETA tracker with 3-, 12-, or 24-second rise time, or gyro aiding, to represent a state-of-the-art navigation system filtering capability. Evaluation criteria included pilot trackkeeping and maneuvering performance as well as system acceptance. The report describes the rationale for variable selection, how they were simulated, and their potential effect on restricted waterway pilotage when the 'benchmark' display is used. Author (GRA)

ATCRBS UPLINK ENVIRONMENT MEASUREMENT NEAR JACKSONVILLE, FLORIDA
F. Nagy, Jr. 25 Sep. 1981 124 p
(Contracts F19628-80-C-0002; DOT-FA72WAI-261; FAA Proj. 052-241-04)
(AD-A108053; ATC-94; FAA-RD-80-70) Avail: NTIS HC A06/MF A01 CSCL 17/7

Airborne measurements of the Air Traffic Control Radar Beacon System (ATCRBS) 1030 MHz uplink environment are described. Measurements were made using the AMF, a special purpose airborne sensor-recorder, during a 23 May 1979 flight in the greater Jacksonville, Florida area. The 2-way flight covered the 450 nm coastline between Fayetteville (NC) and Vero Beach (FL) first at 10,000 then at 25,000 feet. Data recorded at 61 locations have been analyzed to plot combined pulse, interrogation and suppression rates for all locations and individual rates, received powers and angles for 37 locations. Fifty-nine ground interrogators were detected and a list included serves as an all-interrogator/all location (59 x 37) visibility matrix. PRI/PRF distributions of interrogations received are shown at three selected measurement locations. A pulse-by-pulse plot of over 50 Mode 4 interrogations shows their effect on a typical transponder. A worst location is examined for peak instantaneous interrogation rates capable of causing transponder reply-rate limiting (RRL), desensitization and track loss. Durations and periods of recurrence of synchronous jamming for 23 near-equal scan periods are computed. Probabilities or multiple mainbeam coincidences (multi-PRF jamming) are also calculated. Airborne (AMF) and ground based (FAA En-route) coverages are compared, and reported operational problems (target splits, lost tracks, poor coverage) are addressed. Author

THE ZERO-DOPPLER POSITIONING SYSTEM
Wolfgang G. A. Wiebach and Barry L. Stann Sep. 1981 97 p refs

(DA Proj. 1G6-62707-A-576)
(AD-A107806; HDL-TR-1968) Avail: NTIS HC A05/MF A01 CSCL 17/7

This report investigates a radio positioning system for forward artillery observers. The theoretical basis is derived, and implementation schemes are discussed. The preferred implementation is developed in detail and an experimental hardware model is described, giving performance specifications and circuit diagrams of the more important subassemblies. A program of simulated field tests of various degrees of complexity was carried out in the Washington, DC, area; their results are presented.

ANALYTICAL POSITIONING OF AIDS TO NAVIGATION Final Report
Miles A. Millbach Nov. 1981 130 p refs
(AD-A107811; CGR/DC-5/81; USCG-D-22-81) Avail: NTIS HC A07/MF A01 CSCL 17/7

Sophisticated systems such as the Global Positioning System (GPS) and the Inertial Positioning System (IPS) are not yet economically justified for widespread Coast Guard use in positioning aids to navigation. To improve accuracy and precision in positioning until such systems are justified, alternative procedures have been explored. Accuracy and precision are addressed to create various mathematical, statistical and operational procedures immediately applicable to the Coast Guard. This adventure into marine geodesy can help the Coast Guard employ error minimizing positioning procedures until more precise methods and reliable techniques are available.

TIME CORRECTION OF DATA FROM THE NAVSTAR GEODETIC RECEIVER SYSTEM Final Report
Bruce R. Hermann Aug. 1981 75 p refs
(AD-A107643; NSWC/TR-81-174) Avail: NTIS HC A04/MF A01 CSCL 17/7

The NAVSTAR Global Positioning System (NGPS) can be used for geodetic applications. The NAVSTAR Geodetic Receiver System (NGRS) has been developed to demonstrate this capability. In order to use the pseudorange and Doppler observations to do precise point positioning, the time of each observation must be known in the GPS time system. The method used to convert local (NGRS) time to GPS time is described. Author (GRA)

AIRCRAFT POSITION MEASUREMENT USING LASER BEACON OPTICS M.S. Thesis - Princeton Univ.
Steven G. Webb 1981 107 p refs
(AD-A107973; AFIT-CI-81-58T) Avail: NTIS HC A06/MF A01 CSCL 17/7

The development of a system to precisely measure the relative position between two aircraft in-flight utilizing a laser beacon, an optical detector array, and on-board microprocessing is examined. The laser beacon board, mounted on the helicopter, consists of two orthogonal fan-shaped narrow width beams, which rotate at a constant four revolutions per second and have fields of view approaching 166 degrees. The photodiode transmits the detected beams, as pulses, to an electronics system where they pass through a band-pass filter and are converted into digital pulses for signal processing. The laser pulses are detected in the presence of background solar interference through optical spectral filtering of the incident light and electronic filtering of the photodiode signal. Initial tests of the laser beacon and the detector optics have demonstrated the potential for their use as elements of a relative position measurement system. GRA

(NASA-CR-137805) Avail: NTIS HC A07/MF A01 CSCL 01C

A comparison of program estimates of wing weight, material distribution, structural loads and elastic deformations with actual Northrop F-5A/B data is presented. Correlation coefficients obtained using data from a number of existing aircraft were computed for use in vehicle synthesis to estimate wing weights. The modifications necessary to adapt the WADES code for use in the ACSYNT program are described. Basic program flow and overlay structure is outlined. An example of the convergence of the procedure in estimating wing weights during the synthesis of a vehicle to satisfy F-5 mission requirements is given. A description of inputs required for use of the WADES program is included. T.M.

(NASA-CR-165813; LG81ER0222) Avail: NTIS HC A11/MF A01 CSCL 01C

The effects of using advanced turboprop propulsion systems to reduce the fuel consumption and direct operating costs of cargo aircraft were studied, and the impact of these systems on aircraft noise and noise prints around a terminal area was determined. Parametric variations of aircraft and propeller characteristics were investigated to determine their effects on noiseprint areas, fuel consumption, and direct operating costs. From these results, three aircraft designs were selected and subjected to design refinements and sensitivity analyses. Three competitive turbofan aircraft were also defined from parametric studies to provide a basis for comparing the two types of propulsion. S.L.

CONFIGURATION DEVELOPMENT SYSTEM/NAVAIR REPORT Final Report
Daniel Paul Raymer 26 May 1981 8 p
(Contract N00019-80-C-0489)
(AD-A106727; NA-81-290) Avail: NTIS HC A02/MF A01 CSCL 01/3

A fixed price level of effort was performed to install Rockwell's Configuration Development System (CDS) at the Naval Air Systems Command (NAVAIR) facility in Washington, D.C. (Crystal City). Installation of CDS permits NAVAIR the capability to conceptually design aircraft concepts on an interactive graphics terminal and also perform conceptual analysis and concept iteration. Under the contract, the CDS system was converted to run on a VAX 11-780 computer. Program modifications were implemented to allow a greater degree of device-independence, especially for terminal input/output. Also, the CDS program was tested and debugged, the command interpreter was improved, and some additional capabilities were developed. The manual was rewritten including the addition of training materials for classroom and hands-on instruction. Finally, the system was installed and users were trained.

ICE PHOBICS BLADE TRACKING AND COMPARISON OF VIBRATION ANALYSIS TECHNIQUES Final Report, Jun. 1979 - Mar. 1980
William Y. Abbott, Floyd I. Dominick, and Stuart Arthur May 1981 64 p refs
(AD-A108121; USAAEFA-79-86) Avail: NTIS HC A04/MF A01 CSCL 01/3

The United States Army Aviation Engineering Flight Activity conducted an evaluation of two vibration measuring devices, the Chadwick-Helmuth VIBREX and the Scientific-Atlanta Vibration Signature Recorder, as flight test instrumentation. During the course of those evaluations, it was determined that the Dow Corning E2460-40-1 (redesignated E2978-46) ice phobic coating applied to the rotor blades of a UH-1H helicopter, did not induce undesirable vibrations. It was also concluded that the VIBREX may be used as test instrumentation if the frequencies of interest are already known, and the Scientific-Atlanta device provides good 'quick look' spectral vibration data.

THREAT PERCEPTION WHILE VIEWING SINGLE INTRUDER CONFLICTS ON A COCKPIT DISPLAY OF TRAFFIC INFORMATION
Stephen R. Ellis and Everett Palmer Jan. 1982 17 p refs
(NASA-TM-81341; A-8798) Avail: NTIS HC A02/MF A01 CSCL 01D

Subjective estimates of the threat posed by a single intruder aircraft were determined by showing pilots photographs of a cockpit display of traffic information. The time the intruder was away from the point of minimum separation was found to be the major determinant of the perception of threat. When asked to choose a maneuver to reduce the conflict, pilots selected maneuvers with a bias toward those that would have kept the intruders in sight had they been visible out the cockpit window.

AIRCRAFT ALERTING SYSTEMS STANDARDIZATION STUDY. VOLUME 2: AIRCRAFT ALERTING SYSTEM DESIGN GUIDELINES Final Report
B. L. Berson, D. A. Po-Chedley, G. P. Boucek, D. C. Hanson, M. F. Leffler, and R. L. Wasson Jan. 1981 186 p refs
(Contract DOT-FA79WA-4268)
(AD-A106732; D6-49976TN; FAA-RD-81-38-vol-2) Avail: NTIS HC A09/MF A01 CSCL 01/4

This report is one of a series of documented studies directed to the improvement and standardization of aircraft alerting systems. The purpose of the study was to develop and validate, through simulation, functional design criteria that can be used in designing effective aircraft alerting systems. The major objectives of this phase of the study were to: resolve system component questions; validate the two candidate system/concepts by comparison to a representative baseline system, for both the pilot and flight engineer stations; evaluate presentation media and display formats for time-critical warnings; and develop guidelines for the design of alerting systems. This document presents a set of design guidelines directed to the improvement and standardization of aircraft alerting systems. The objective of the guidelines is not to define a simple hardware design that each manufacturer must use, but rather to provide functional design criteria that can be used to develop effective alerting systems, and to promote standardization within the industry.

A COMPUTER CODE FOR SWIRLING TURBULENT AXISYMMETRIC RECIRCULATING FLOWS IN PRACTICAL ISOTHERMAL COMBUSTOR GEOMETRIES Final Report
D. G. Lilley and D. L. Rhode Washington NASA Feb. 1982 134 p refs
(Grant NAG3-74)
(NASA-CR-3442) Avail: NTIS HC A07/MF A01 CSCL 21E

A primitive pressure-velocity variable finite difference computer code was developed to predict swirling recirculating inert turbulent flows in axisymmetric combustors in general, and for application to a specific idealized combustion chamber with sudden or gradual expansion. The technique involves a staggered grid system for axial and radial velocities, a line relaxation procedure for efficient solution of the equations, a two-equation k-epsilon turbulence model, a stairstep boundary representation of the expansion flow, and realistic accommodation of swirl effects. A user's manual, dealing with the computational problem, showing how the mathematical basis and computational scheme may be translated into a computer program is presented. A flow chart, FORTRAN IV listing, notes about various subroutines and a user's guide are supplied as an aid to prospective users of the code. Author

COMPARISON OF ACOUSTIC DATA FROM A 102 MM CONIC NOZZLE AS MEASURED IN THE RAE 24-FOOT WIND TUNNEL AND THE NASA AMES 40- BY 80-FOOT WIND TUNNEL
A. Atencio, Jr. and J. McKie (Royal Aircraft Establishment, England) Jan. 1982 23 p refs
(NASA-TM-81343; A-8801) Avail: NTIS HC A02/MF A01 CSCL 21E

A cooperative program between the Royal Aircraft Establishment (RAE), England, and the NASA Ames Research Center was initiated to compare acoustic measurements made in the RAE 24-foot wind tunnel and in the Ames 40- by 80-foot wind tunnel. The acoustic measurements were made in both facilities using the same 102 mm conical nozzle supplied by the RAE. The nozzle was tested by each organization using its respective jet test rig. The mounting hardware and nozzle exit conditions were matched as closely as possible. The data from each wind tunnel were independently analyzed by the respective organization. The results from these tests show good agreement. In both facilities, interference with acoustic measurement is evident at angles in the forward quadrant. Author

BRITTLE MATERIALS DESIGN, HIGH TEMPERATURE GAS TURBINE Final Report, 1 Jul. 1971 - 31 Aug. 1979
Arthur F. McLean and Eugene A. Fisher Mar. 1981 232 p refs
(Contract DAAG46-71-C-0162; DARPA Order 1849)
(AD-A106670; AMMRC-TR-81-14) Avail: NTIS HC A11/MF A01 CSCL 21/5

A goal of 200 hours of engine rig demonstrations for representative duty cycle temperatures in a regenerated vehicular gas turbine was chosen, with uncooled ceramic components to operate at least 25 hours at 2500 F, beyond the temperatures possible with uncooled metal components. The total systems approach included major efforts in ceramic design, materials development, fabrication process development, and test and evaluation methodology. Progress was made in each of these areas during the course of the program. For example, the strength of reaction bonded silicon nitride (RBSN) used in the stator and rotor blades was more than tripled. By the end of the program, 200 hours of duty cycle durability on turbine test rigs (between 1930 F - 2500 F) was attained on RBSN stationary components including stators, nose cones and turbine rotor tip shrouds. Similarly, 200 hours of duty cycling on test rigs was attained with reaction sintered SiC combustors and stators. GRA

A COMPUTER PROGRAM FOR VARIABLE-GEOMETRY SINGLE-STAGE AXIAL COMPRESSOR TEST DATA ANALYSIS (UD0400) Interim Report, 1 Jun. 1980 - 31 May 1981
C. Herbert Law Sep. 1981 147 p refs
(AF Proj. 2307)
(AD-A106676; AFWAL-TR-81-2078) Avail: NTIS HC A07/MF A01 CSCL 21/5

This report describes a computer program that is designed for the analysis of single-stage axial compressor data. The axisymmetric flow of a thermally perfect compressible fluid is assumed, and the streamline curvature method of solution is employed. Details of the blade geometry may be computed or input, and a detailed account of the flow through the blading may be obtained. The analysis is limited to a single-stage compressor, but inlet guide vanes may be included. Variable geometry is permitted in both the inlet guide vanes and the stator vanes. An option in the analysis is to match computed and experimental static pressures at any radius by varying annulus blockage or relative flow deviation angles. Author (GRA)

08 AIRCRAFT STABILITY AND CONTROL

AN INVESTIGATION OF AUTOMATIC GUIDANCE CONCEPTS TO STEER A VTOL AIRCRAFT TO A SMALL AVIATION FACILITY SHIP
J. A. Sorensen, T. Goka, A. V. Phatak, and S. F. Schmidt Jul. 1980 253 p refs
(Contract NAS2-10288)
(NASA-CR-152407) Avail: NTIS HC A12/MF A01 CSCL 01C

A detailed system model of a VTOL aircraft approaching a small aviation facility ship was developed and used to investigate several approach guidance concepts. A preliminary analysis of the aircraft-vessel landing guidance requirements was conducted. The various subelements and constraints of the flight system are described including the landing scenario, lift fan aircraft, state rate feedback flight control, MLS-based navigation, sea state induced ship motion, and wake turbulence due to wind-over-deck effects. These elements are integrated into a systems model with various guidance concepts. Guidance is described in terms of lateral, vertical, and longitudinal axes steering modes and approach and landing phases divided by a nominal hover (or stationkeeping) point defined with respect to the landing pad. The approach guidance methods are evaluated, and the two better steering concepts are studied by both single pass and Monte Carlo statistical simulation runs. Four different guidance concepts are defined for further analysis for the landing phase of flight. J.M.S.

AUTOMATION OF ON-BOARD FLIGHTPATH MANAGEMENT
Heinz Erzberger Dec. 1981 22 p refs
(NASA-TM-84212; A-8809) Avail: NTIS HC A02/MF A01 CSCL 07C

The status of concepts and techniques for the design of onboard flight path management systems is reviewed. Such systems are designed to increase flight efficiency and safety by automating the optimization of flight procedures onboard aircraft. After a brief review of the origins and functions of such systems, two complementary methods are described for attacking the key design problem, namely, the synthesis of efficient trajectories. One method optimizes en route, the other optimizes terminal area flight; both methods are rooted in optimal control theory. Simulation and flight test results are reviewed to illustrate the potential of these systems for fuel and cost savings. J.M.S.

A PROGRAM TO EVALUATE A CONTROL SYSTEM BASED ON FEEDBACK OF AERODYNAMIC PRESSURE DIFFERENTIALS Final Report
David W. Levy, Paul Finn, and Jan Roskam Dec. 1981 205 p refs
(Grant NAG4-5)
(NASA-CR-163466; KU-FRL-490-2) Avail: NTIS HC A10/MF A01 CSCL 01C

The use of aerodynamic pressure differentials to position a control surface is evaluated. The system is a differential pressure command loop, analogous to a position command loop, where the surface is commanded to move until a desired differential pressure across the surface is achieved. This type of control is more direct and accurate because it is the differential pressure which causes the control forces and moments. A frequency response test was performed in a low speed wind tunnel to measure the performance of the system. Both pressure and position feedback were tested. The pressure feedback performed as well as position feedback implying that the actuator, with a break frequency on the order of 10 Rad/sec, was the limiting component. Theoretical considerations indicate that aerodynamic lags will not appear below frequencies of 50 Rad/sec. or higher. S.L.

CALIBRATION OF THE AMES ANECHOIC FACILITY. PHASE 1: SHORT RANGE PLAN Final Report, Dec. 1980

David Hickey, Paul T. Soderman, K. Karamcheti, S. P. Koutsoyannis, R. Hopkins, and B. McLachlan Dec. 1980 129 p refs
Prepared in cooperation with Stanford Univ., Calif.
(NASA-TM-84061) Avail: NTIS HC A07/MF A01 CSCL 14B

A calibration was made of the acoustic and aerodynamic characteristics of a small, open-jet wind tunnel in an anechoic room. The jet nozzle was 102 mm diameter and was operated subsonically. The anechoic-room dimensions were 7.6 m by 5.5 m by 3.4 m high (wedge tip to wedge tip). Noise contours in the chamber were determined by various jet speeds and exhaust collector positions. The optimum nozzle/collector separation from an acoustic standpoint was 2.1 m. Jet velocity profiles and turbulence levels were measured using pressure probes and hot wires. The jet was found to be symmetric, with no unusual characteristics. The turbulence measurements were hampered by oil mist contamination of the airflow. Author

RESEARCH THROUGH SIMULATION

James L. Copeland, comp. [1982] 30 p refs
(NASA-Facts-125) Avail: NTIS HC A03/MF A01 CSCL 14B

The design of the computer operating system at Langley Research Center allows for concurrent support of time-critical simulations and background analytical computing on the same machine. Signal path interconnections between computing hardware and flight simulation hardware is provided to allow up to six simulation programs to be in operation at one time. Capabilities and research applications are discussed for the: (1) differential maneuvering simulator; (2) visual motion simulator; (3) terminal configured vehicle simulator; (4) general aviation aircraft simulator; (5) general purpose fixed based simulator; (6) transport simulator; (7) digital fly by wire simulator; (8) general purpose fighter simulator; and (9) the roll-up cockpit. The visual landing display system and graphics display system are described and their simulator support applications are listed. A.R.H.

DEVELOPMENT OF THE AUTOMATED AFAPL ENGINE SIMULATOR TEST FOR LUBRICANT EVALUATION Final Technical Report, 1 May 1978 - 1 Jan. 1981

B. B. Baber, M. L. Valtierra, and J. E. Eichelberger Wright-Patterson AFB, Ohio AFWAL May 1981 104 p refs
(Contract F33615-78-C-2012; AF Proj. 3048)
(AD-A106128; SWRI-MED-119; AFWAL-TR-81-2022) Avail: NTIS HC A06/MF A01 CSCL 14/2

A description of an automated gas turbine engine simulator, designated the AFAPL engine simulator, and a discussion of the test results obtained using the simulator are presented. The No. 4-5 bearing compartment areas of a J57 turbine engine are used as the basic hardware for the simulator. The simulator is driven by a variable-speed drive system, through the accessory drive gearbox, providing simulator mainshaft speeds up to 10,000 rpm. Electrical resistance heaters are used to heat the air surrounding the oil-wetted areas within the No. 4-5 bearing compartment areas. The temperatures, pressures, and rpm are automatically controlled at predetermined levels and monitored throughout the 9120-6000 rpm speed cycling sequences and the soakback periods by a Hewlett-Packard mini-computer system, which is also programmed to automatically draw 5-hr interval test-oil samples, control test-oil sump level, provide safety shut-off protection, as well as print out and plot test information generated during each individual test. Simulator results obtained on eight turbine engine lubricants, for which full-scale engine data are available, show a very good correlation of the deposit ratings obtained using the AFAPL engine simulator and the deposit ratings from full-scale engine tests. CURRENT PRESSURE MEASURING SYSTEM IN THE TRANSONIC WIND TUNNEL

J. B. Willis May 1981 16 p ref
(AD-A106272; ARL/AERO-TM-328) Avail: NTIS HC A02/MF A01 CSCL 14/2

A simple system for wind tunnel pressure measurements is described. It is intended for use with Scanivalves, a minicomputer and stagger scans at a preset, variable rate. The scan may be started and stopped under program control, and all Scanivalves are automatically homed at the end of the computer initiated scan. Scanivalve number, port number, and four digits representing the measured pressure are displayed and provided for the minicomputer. Author (GRA)

ARC CONTROL EXPERIMENTS USING A HIGH PERFORMANCE ARC HEATER Final Report, 1 Sep. 1980 - 30 Jun. 1981

J. H. Painter Arnold Air Force Station, Tenn. AEDC Oct. 1981 80 p refs
(Contract F40600-80-C-0005)
(AD-A106140; AEDC-TR-81-20) Avail: NTIS HC A05/MF A01 CSCL 14/2

Arc control parameters varied in these experiments were: arc current, arc pressure, air flow rate, starting ramp rate, arc polarity, component resistance to ground, spin coil current, and gas injection distribution. Geometric parameters varied were: nozzle throat area, constrictor length, and gas injection radius. Arc characteristics were documented on high-speed motion picture film at rates to 10,800 frames per second and by oscillograph. Analysis of these data indicated all of the parameters investigated had an effect on arc behavior and these effects are documented herein. The role of gas circulation and internal magnetic fields dominated other variations of the control parameters. Reduction of the nozzle throat area by a factor of two had a strong influence on the circulation level and arc instabilities resulted. Intersegment arcing was photographed at high frame rates as were other arc instabilities such as blow-through, roll-over, and kinking. Methods of improving the arc control and stability were identified and evaluated within the scope of the program. A total of 50 arc heater tests were made at arc currents to 830 A and pressures to 50 atm. GRA

QOT AND E OF THE F-16 20MM AMMUNITION LOADING SYSTEM'S ABILITY TO UPLOAD/DOWNLOAD A-7D AIRCRAFT Final Report
27 Oct. 1981 8 p
(AD-A108007) Avail: NTIS HC A02/MF A01 CSCL 19/1

The purpose of this qualification operational test and evaluation (QOT and E) was to evaluate the ability of the F-16 20mm ALS to upload/download A-7D aircraft. Testing included uploading/downloading of 20mm ammunition on A-7D aircraft during normal day-to-day operations and during simulated combat conditions. A portion of the test was conducted with load crews wearing chemical warfare defense ensembles (CWDE). Specific Objectives are: Operational Effectiveness - to assess the capability of the F-16 ALS to upload/download ammunition into/from the A-7D aircraft; to assess the interoperability of the ALS with both the A-7D gun system and the modified replenisher, and to assess the capability of the modified replenisher to replenish the loader. Operational Suitability - Specific suitability objectives were not evaluated during this test. On site observations of some suitability areas (equipment failures, technical data, human factors, and chemical defense) were performed. GRA

PROPER FREQUENCIES OF A DOWN-LOOKING WATER-VAPOR RADIOMETER OVER SEA SURFACE c35
S. C. Wu *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 4-14 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 14B

Altimeter observation on board an Earth-orbiting satellite over sea surface is corrupted by the water vapor path delay. Such error can be calibrated for by a down-looking microwave radiometer. The effects of water vapor profile, sea surface temperature, wind speed and brightness temperature measurment error on the calibration precision were studied. Proper frequency combinations were also searched to minimize these effects. The analysis indicates that it is possible to achieve a subcentimeter estimate of water vapor path delay on nadir observation with an on-board microwave radiometer. M.D.K.

A VLBI SURVEY OF THE NORTHERN POLAR CAP REGION c46
D. D. Morabito, R. A. Preston, and J. Faulkner *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 30-36 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 08E

A VLBI (Very Long Baseline Interferometry) survey at 2.29 GHz of the nothern polar cap region (declination > 69 deg) was conducted using a baseline consisting of the NASA Deep Space Network (DSN) sites at Goldstone, California and Madrid, Spain. The purpose of this survey was to identify sources in the northern polar cap region which possess milliarcsecond components. High declination VLBI sources provide valuable geometric coverage for determining the spin axis components of baselines. Out of 48 candidate sources selected from the Bonn 5-GHz survey, 42 were detected to have compact structure on the California/Spain baseline at the 2.29-GHz observing frequency. This polar survey is part of a more general VLBI sky survey. Author

ARCSECOND POSITIONS FOR MILLIARSECOND VLBI NUCLEI OF EXTRAGALACTIC RADIO SOUCES. PART 1: 546 SOURCES c93
D. D. Morabito, R. A. Preston, M. A. Slade, and D. L. Jauncey (CSIRO, Sydney) *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 37-48 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 03B

Very long Baseline Interferometry measurements at 2290 MHz on baselines of approximately 10 to the 4th power km between Deep Space Network stations were used to identify sources that are suitable for precision astrometric applications. The use of relatively crude time delay measurements along with fringe frequency measurements to determine the positions of the milliarcsecond nuclei in 546 extragalactic sources with accuracies of generally approximately 1' is described. The calculated positions of the sources and the corresponding uncertainties are presented and the positions are referenced to the equinox of 1950.0 and elliptical aberration terms are included so as to agree with past astronomical convention. The source positions and position uncertainties for sources which were multiply observed were estimated from a weighted average. The reliability of the determined positions was demonstrated by testing the repeatability of multiple observations on the same source and by position comparisons with more accurate radio catalogs. M.D.K.

N82-16110*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
AN FM/CW METHOD FOR THE MEASUREMENTS OF TIME DELAYS OF LARGE CASSEGRAIN ANTENNAS c32
T. Y. Otoshi *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 49-59 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 20N

An FM/CW measurement technique which utilizes the time domain principle was developed to measure the time delays of large Cassegrain antennas. Measured primary path delays of 60 ns (or greater) typically agreed with calculated delays to within 3 ns. Multipath sources generated within the antenna optics region were identified. The FM/CW technique in conjuction with the horn-on-dish configuration proved to be the most rapid, convenient, and accurate method for calibrating absolute time delays for a large antenna. The FM/CW instrumentation was invaluable as a diagnostics tool and facilitated increased understanding of the mechanisms of multipath signal generation within the antenna optics media multipath signals that could be deleterious to accuracy of antenna time delay calibrations. M.D.K.

AN M-ARY COHERENT OPTICAL RECEIVER FOR THE FREE-SPACE CHANNEL c74
V. A. Vilnrotter *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 60-66 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 20F

The free-space channel is an ideal medium for communicating by means of spatially and temporally coherent optical fields. The structure of a coherent optical receiver for M-ary signals is derived assuming Poisson detection statistics. Receiver performance is evaluated for an M-ary signal set consisting of orthogonal Walsh-functions under the assumption of high-intensity symbol counts. The asymptotic performance bound is examined in the limit as both the dimension of the signal-set and the receiver bandwidth become arbitrarily large and it is shown that on the average a maximum of nearly three bits of information can be encoded onto each received photon using the above modulation scheme. Author

X-BAND NARROW-BEAM RADIOMETER FOR DSS 13 c35
M. M. Franco, S. D. Slobin, and C. T. Stelzried *In its* the Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 80-86 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 14B

The design and testing of a narrow-beam X-band (8.44 GHz) radiometer is described. Continuous calibration is obtained by switching the receiver sequentially among the hot termination, ambient termination, and antenna noise positions. The measured antenna noise temperatures (10 second total integration time) have a standard deviation of about 0.4 K, which is in good agreement with theory. It is felt that radiometer performance is satisfactory for the purpose of making atmospheric noise temperature measurements. J.D.H.

Avail: NTIS HC A16/MF A01 CSCL 09C

Ground station antenna designs which have a clear aperture (no subreflector or strut blockage) and shaped reflector surfaces are described. The design of a 1.5-m, 32-GHz clear aperture

antenna model is discussed. Underlying considerations leading to the determination of the parameters defining the model antenna geometry are presented.
J.D.H.

N82-16115*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.

POWER EFFICIENCY OF SEMICONDUCTOR INJECTION LASERS

J. Katz *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 94-100 refs (For primary document see N82-16101 07-12) c36

Avail: NTIS HC A16/MF A01 CSCL 20E

Analysis of a model of semiconductor injection lasers was carried out in terms of the basic parameters relevant to efficient device operations (i.e., device length, mirror reflectivity, absorption coefficient and material conductivity). The efficiency is improved as the optical absorption coefficient and the resistivity of the laser material are reduced. The maximum output intensity or the maximum photon density of the laser are specified; these parameters are constrained by reliability considerations. When all these are determined, there will exist a unique value of laser length and laser reflectivity which will optimize the laser efficiency for each application. It is important to note that all the device parameters must be adequately designed in order to optimize its overall power efficiency.

N82-16116*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.

PHASE-LOCKING OF SEMICONDUCTOR INJECTION LASERS

J. Katz *In its* the Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 101-114 refs (For primary document see N82-16101 07-12) c36

Avail: NTIS HC A16/MF A01 CSCL 20E

The problem of phase-locking of several semiconductor injection lasers via mutual coupling was investigated. The equations of motion of the parameters of both individual lasers and an array of lasers were derived considering both coupling via field overlapping and interactions via the active media. The solution of the equations was outlined and the conditions for obtaining phase-matching were derived. The sign of the coupling constraints must be negative, and its magnitude must be greater than the standard deviation of the laser transition frequency deviations. The actual magnitude of the coupling coefficients in several configurations were calculated, and the results indicate that is possible, although not trivial, to achieve the coupling conditions.

A DIGITAL FILTER IMPLEMENTATION OF THE DEEP SPACE TRANSPONDER PHASE LOCK LOOP INTEGRATOR

J. W. Heller *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 138-147 ref (For primary document see N82-16101 C7-12) c33

Avail: NTIS HC A16/MF A01 CSCL 09C

Having suffered in reliability due to malfunctioning capacitors, the phase lock loop integrating filter in the NASA standard deep space transponder is reconsidered. An alternative design, using a digital filter which eliminates these critical components is presented. The analog-to-digital conversion, digital filtering, and digital-to-analog conversion are all performed by an Intel 2920 digital signal processing integrated circuit. The circuit was tested for its step response and frequency response. The output for a 0.75 volt step input was recorded over a 3 hour period at 5 minute intervals and compared with the ideal response to the linear integrator. The maximum error was 1.5 percent. The filter was not tested in a loop.

IMPROVED CARRIER TRACKING PERFORMANCE WITH COUPLED PHASE-LOCKED LOOPS

D. Divsalar and J. H. Yuen (California Inst. of Technology) *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 148-171 refs (For primary document see N82-16101 07-12) c32

Avail: NTIS HC A16/MF A01 CSCL 17B

A carrier arraying system to combine the received carrier signals at geographically separated receivers with different carrier phases to improve carrier tracking performance is considered. This system basically couples several phase-locked loops to enhance received carrier signal-to-noise ratio. There is no extra alignment of carrier phases. This system automatically aligns the carrier phases, which results in coherent combining of the carrier signals. The tracking performance of this carrier arraying system are analyzed by assessing its rms phase jitter and radio loss. Carrier arraying alone will not provide any improvement in bit energy to noise spectral density ratio. However, carrier arraying provides reduction in radio loss with respect to the no carrier arraying case. Results were extended to the case of combined carrier and baseband arraying. Bit error rates and radio loss curves are given. Numerical results are given for three useful cases, namely, the array of 64/34, the array of 64/34/34 and the array of 64/34/34 meter-antenna stations of the NASA Deep Space Network.

IMPLICATIONS OF THE PUTNAM SOFTWARE EQUATION ON CONFIDENCE LEVELS FOR PROJECT SUCCESS

R. C. Tausworthe *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 172-185 refs (For primary document see N82-16101 07-12) c61

Avail: NTIS HC A16/MF A01 CSCL 09B

The implications of assumed powerlaw relationships among size, duration, and effort on the probability that a given software project will be completed within its estimated schedule and manpower resources are investigated. Software development tasks are treated as sample point in a probability space characterized by three random variables: size, duration, and resource expenditure. The completion confidence factor is then computed. The most astonishing conclusion is the low confidence factor of the average project, significantly less than 25%. This low confidence factor is the results of correlation of the project duration and work effort by a tradeoff relationship referred to as 'Putnam's software equation'.

It is shown that (1) the array gain increases as antennas are added to the array, (2) the error bars do not grow under the constraint that the performance of all elements is equally well known, and (3) the knowledge of the 64-meter antenna performance is more important to the array than knowledge of the 34-meter antennas and therefore, most effort should be spent quantifying the larger antenna. LIFE-CYCLE COST ANALYSIS OF PROJECTS USING A POLYNOMIAL CASH FLOW MODEL FOR NONUNIFORM MAINTENANCE AND OPERATIONS COSTS c83
D. S. Remer and G. Lorden (California Inst. of Technology) *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 191-201 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 05C

A mathematical model is developed for calculating the life-cycle costs for a project where the maintenance and operations (M&O) costs change in a nonlinear manner with time. Closed-form solutions are presented for computing the present worth of projects with periodic cash flow profiles that can be approximated by polynomial functions. The results show that the life-cycle cost for a project can be grossly underestimated (or overestimated) if the M&O costs increase or decrease nonuniformly over time rather than being constant or linear as is often assumed in project economic evaluations. The following range of variables is examined: (1) project life from 2 to 15 years, (2) interest rate from 0 to 30 percent per year, and (3) polynomials of order 0 to 5. Simplified solutions or the present worth are presented for two limiting cases: extented project lifetime and negligible interest rate. Also a simplified expression is provided for accurate present worth M&O estimates for DSN projects. In addition, a sensitivity analysis of the model based on graphical results and a numerical example plus tables and graphs are given to help the reader calculate M&O life-cycle costs over a wide range of variables. EMERGENCY TELEMETRY PERFORMANCE

c17

W. Tisdale *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 335-340 ref (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 09F

Often an emergency telemetry mode is automatically selected by a spacecraft during emergencies. During such emergencies the Deep Space Network must acquire the spacecraft telemetry as rapidly as possible under weak fluctuating signal conditions. Test data herein show the bit error properties of one emergency telemetry mode candidate with a very low bit rate of 4 bits per second. Analysis reveals the E sub b/N sub O necessary to obtain the performance bit error rate threshold and associated acquisition times.

A SOLAR POWERED WATER PURIFICATION SYSTEM AT GOLDSTONE (DSS 13)

c44

F. J. Menninger and R. J. Elder *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 352-354 (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 10A

The present energy intensive electrically powered still at the Venus Deep Space Station (DSS 13) has reached its end-of-life. The electric still has been producing the pure water required for cooling the 400-kW klystron tube of the Venus 26-m antenna at Goldstone, California. A new passive solar still, unique to the Goldstone complex, has been designed to replace the electric still. This new system will deliver 100% of the pure water requirement for cooling the klystron tube and will consume an insignificant amount of electrical energy. Construction will be completed by the end of 1981, followed by a one-year test and evaluation period to gather data on performance characteristics.

ENERGY CONSUMPTION FOR THE ECHO STATION (DSS 12)

c44

C. N. Guiar and D. Schonfeld *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 355-363 refs (For primary document see N82-16101 07-12)
Avail: NTIS HC A16/MF A01 CSCL 10B

Energy consumption for the Echo Station is analyzed. The HVAC equipment including vapor compression refrigeration units, absorption chillers, annd heating units such as boilers and heat pumps is shown to be the largest consumer of electrical energy. The energy consumption for the buildings at the station is itemized and compared to the electrical meter data. The figures for energy consumption as predicted by the ECP computer program are found to agree well with the meter data.

MISSION OPERATION REPORT: SPACE SHUTTLE PROGRAM STS-2
[1982] 25 p refs
(NASA-TM-84088; M-989-81-02) Avail: NTIS HC A02/MF A01 CSCL 22A

Objectives for the second space shuttle mission are reviewed and their achievement assessed. Details of the flight are described with emphasis on launch; ascent; solid rocket booster and external tank disposal; on-orbit; descent and landing; and ground operations and turnaround. The net result of the implementation of the adjusted preplanned minimum mission of 54 hours (instead of the 124 hour mission) was that approximately 90% of the major functional test objectives were successfully accomplished, and 60% of the tests requiring on-orbit crew involvement were completed. Of the total 308 tests planned for the full duration mission, 253 (82%) were accomplished. Of 94 desired science data takes, 64 were completed and about 73 hours of data were acquired on the various sensors. A.R.H.

REPORT BY THE AEROSPACE SAFETY ADVISORY PANEL Annual Report, 1981
1981 37 p refs
(NASA-TM-84094) Avail: NTIS HC A03/MF A01 CSCL 22A

The process of preparation for the first two shuttle flights was observed and information from both flights was gathered in order to confirm the concept and performance of the major elements of the space transportation system. To achieve truly operational operating safety, regularity, and minimum practical cost, the organization of efforts between the R&D community and any transportation service organization should be clearly separated with the latter organization assuming responsibilities for marketing its services; planning and acquiring prime hardware and spares; maintainance; certification of procedures; training; and creation of requirements for future development. A technical audit of the application of redundancy concepts to shuttle systems is suggested. The state of the art of space transportation hardware suggests that a number of concept changes may improve reliability, costs, and operational safety. For the remaining R&D

flights, it is suggested that a redline audit be made of limits that should not be exceeded for ready to launch. A.R.H.

HC A06/MF A01 CSCL 22B

A non-recursive model (based on von Karman spectra) for atmospheric turbulence along the flight path of the shuttle orbiter was developed. It provides for simulation of instantaneous vertical and horizontal gusts at the vehicle center-of-gravity, and also for simulation of instantaneous gusts gradients. Based on this model the time series for both gusts and gust gradients were generated and stored on a series of magnetic tapes, entitled Shuttle Simulation Turbulence Tapes (SSTT). The time series are designed to represent atmospheric turbulence from ground level to an altitude of 120,000 meters. A description of the turbulence generation procedure is provided. The results of validating the simulated turbulence are described. Conclusions and recommendations are presented. One-dimensional von Karman spectra are tabulated, while a discussion of the minimum frequency simulated is provided. The results of spectral and statistical analyses of the SSTT are presented. N.W.

FEASIBILITY STUDY FOR LONG LIFETIME HELIUM DEWAR Final Report, Jan. - Dec. 1981
R. T. Parmley Dec. 1981 191 p refs
(Contract NAS2-10848)
(NASA-CR-166254) Avail: NTIS HC A09/MF A01 CSCL 22B

A feasible concept for a launchable three year lifetime helium dewar was investigated. Current helium dewar designs were examined to see where the largest potential reductions in parasitic heat loads can be made. The study was also devoted to examining support concepts. The support concept chosen, a passive orbital disconnect strut (PODS), has an orbital support conductance that is lower by more than an order of magnitude over current tension band supports. This lower support conductance cuts the total dewar weight in half for the same three year life time requirements. Effort was also concentrated on efficient wire feed through designs and vapor cooling of the multilayer insulation, supports, wire feed throughs and plumbing penetrations. A single stage helium dewar vs. dual stage dewars with a guard cryogen of nitrogen or neon was examined. The single stage dewar concept was selected. Different support concepts were analyzed from which the PODS support concepts was chosen. A preliminary design of the dewar was thermally and structurally analyzed and laid out including system weights, thermal performance and performance sensitivities. S.L.

NATURAL MODES AND REAL MODAL VARIABLES FOR FLEXIBLE SPACECRAFT
F. R. Vigneron Nov. 1981 23 p refs
(CRC-1348) Avail: NTIS HC A02/MF A01

A natural model transformation theory which is applicable to flexible spacecraft with damping and gyroscopic forces is described. The theory is arranged into a form which is a generalization of the classical normal modes transformation theory. Modal differential equations are given in terms of real-value scalars. Block diagrams in the time and Laplace transform domains demonstrate the feed-forward and second-order filter characteristics of the structure of the equations. Results for a single-axis flexible dynamics example are compared with earlier published results to show the correlation with the classical normal modes transformation theory. B.W.

THE MICROWAVE RADIOMETER SPACECRAFT: A DESIGN STUDY
Robert L. Wright, ed. Dec. 1981 239 p refs
(NASA-RP-1079; L-14258) Avail: NTIS HC A11/MF A01 CSCL 22B

A large passive microwave radiometer spacecraft with near all weather capability of monitoring soil moisture for global crop forecasting was designed. The design, emphasizing large space structures technology, characterized the mission hardware at the conceptual level in sufficient detail to identify enabling and pacing technologies. Mission and spacecraft requirements, design and structural concepts, electromagnetic concepts, and control concepts are addressed. For individual titles, see N82-16154 through N82-16167.

MISSION DEFINITION FOR A LARGE-APERTURE MICROWAVE RADIOMETER SPACECRAFT
Lloyd S. Keafer, Jr. *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 17-32 refs (For primary document see N82-16153 07-18)
Avail: NTIS HC A11/MF A01 CSCL 22B

An Earth-observation measurements mission is defined for a large-aperture microwave radiometer spacecraft. This mission is defined without regard to any particular spacecraft design concept. Space data application needs, the measurement selection rationale, and broad spacecraft design requirements and constraints are described. The effects of orbital parameters and image quality requirements on the spacecraft and mission performance are discussed. Over the land the primary measurand is soil moisture; over the coastal zones and the oceans important measurands are salinity, surface temperature, surface winds, oil spill dimensions and ice boundaries; and specific measurement requirements have been selected for each. Near-all-weather operation and good spatial resolution are assured by operating at low microwave frequencies using an extremely large aperture antenna in a low-Earth-orbit contiguous mapping mode. HIGH-RESOLUTION PASSIVE MICROWAVE IMAGING OF THE SURFACE OF THE EARTH
Calvin T. Swift *In* NASA. Langley Research Center The Mirowave Radiometer Spacecraft Dec. 1981 p 3-41 refs (For primary document see N82-16153 07-18)
Avail: NTIS HC A11/MF A01 CSCL 22B

The physics of passive microwave observations of the Earth and the system requirements for high-resolution imaging within this spectral band are summarized. High resolution is achieved in a straightforward manner by increasing the size of the primary antenna. However, with a single receiver, it is shown that the combination of high resolution and crosstrack scanning cannot produce images which have valuable geophysical content. The concept of a multiple receiver array located in the focal plane is presented as the only practical solution to the dilemma. Exploring this concept, system requirements are generated which, for the first order, appear to offer solutions to the problem. Author

RADIOMETER DESIGN CONCEPTS FOR LARGE APERTURE MICROWAVE RADIOMETER SPACECRAFT

Lloyd S. Keafer, Jr. *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 43-49 refs (For primary document see N82-16153 07-18)

Avail: NTIS HC A11/MF A01 CSCL 22B

Concepts involving active and passive microwave systems for soil-moisture monitoring are discussed. It is shown that the first major development efforts should be directed toward the simpler passive design concepts. Subsequently, five passive design concepts for a microwave radiometer spacecraft are outlined and compared. Some common technology needs, such as large space structures and controls, are shown to exist. Also, some peculiar technology needs are identified, such as complicated phasing networks, dielectric lenses, tapered illumination, and reflector-surface irregularity and distortion control techniques. More detailed studies to address these design concepts and assess the associated technology needs are recommended. J.M.S.

SYSTEMS DESIGN AND ANALYSIS OF THE MICROWAVE RADIOMETER SPACECRAFT

L. Bernard Garrett *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 69-94 refs (For primary document see N82-16153 07-18)

Avail: NTIS HC A11/MF A01 CSCL 22B

Systems design and analysis data were generated for microwave radiometer spacecraft concept using the Large Advanced Space Systems (LASS) computer aided design and analysis program. Parametric analyses were conducted for perturbations off the nominal-orbital-altitude/antenna-reflector-size and for control/propulsion system options. Optimized spacecraft mass, structural element design, and on-orbit loading data are presented. Propulsion and rigid-body control systems sensitivities to current and advanced technology are established. Spacecraft-induced and environmental effects on antenna performance (surface accuracy, defocus, and boresight off-set) are quantified and structured material frequencies and modal shapes are defined. PRELIMINARY DESIGN OF TETRAHEDRAL TRUSS REFLECTOR STRUCTURE

Michael F. Card and J. Kermit Jensen (Kentron International, Inc.) *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 95-107 refs (For primary document see N82-16153 07-18)

Avail: NTIS HC A11/MF A01 CSCL 22B

A baseline structure proposed for the microwave radiometer spacecraft (MRS) reflector is a large graphite-epoxy truss. The truss structure was selected to provide adequate stiffness to minimize control problems and to provide a low-expansion 'strong back' on which to mount and control reflector mesh panels. Details of the structural members, joints and assembly concepts are presented; a concept for the reflector mesh surface is discussed, and preliminary estimates of the mass and structural natural frequencies of the reflector system are presented. Author

ELECTROMAGNETIC DESIGN OF A MICROWAVE RADIOMETER ANTENNA SYSTEM

P. K. Agrawal (RCA, Moorestown, N.J.) and C. R. Cockrell *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 129-136 refs (For primary document see N82-16153 07-18)

Avail: NTIS HC A11/MF A01 CSCL 22B

A preliminary electromagnetic (EM) design of a radiometric antenna system was developed for the microwave radiometer spacecraft mission. The antenna system consists of a large spherical reflector and an array of feed horns along a concentric circular arc in front of the reflector. The reflector antenna was sized to simultaneously produce 200 contiguous 1 km diameter footprints with an overall beam efficiency of 90 percent, and the feed horns and feed horn array were designed to monitor the radiation from the footprints. ADAPTIVE CONTROL SYSTEM FOR LARGE ANNULAR MOMENTUM CONTROL DEVICE

Raymond C. Montgomery and C. Richard Johnson, Jr. (Virginia Polytechnic Inst. and State Univ.) *In its* The Microwave Radiometer Spacecraft Dec. 1981 p 169-187 refs (For primary document see N82-16153 07-18)

Avail: NTIS HC A11/MF A01 CSCL 22B

A dual momentum vector control concept, consisting of two counterrotating rings (each designated as an annular momentum control device), was studied for pointing and slewing control of large spacecraft. In a disturbance free space environment, the concept provides for three axis pointing and slewing capabilities while requiring no expendables. The approach utilizes two large diameter counterrotating rings or wheels suspended magnetically in many race supports distributed around the antenna structure. When the magnets are energized, attracting the two wheels, the resulting gyroscopic torque produces a rate along the appropriate axis. Roll control is provided by alternating the radiative rotational velocity of the two wheels. Wheels with diameters of 500 to 800 m and with sufficient momentum storage capability require rims only a few centimeters thick. The wheels are extremely flexible; therefore, it is necessary to account for the distributed nature of the rings in the design of the bearing controllers. Also, ring behavior is unpredictably sensitive to ring temperature, spin rate, manufacturing imperfections, and other variables. An adaptive control system designed to handle these problems is described. J.M.S.

(Contract NAS8-34263)
(NASA-CR-161953; TR-81-04-Vol-1) Avail: NTIS HC A09/MF A01 CSCL 14B

The performance of a star tracker equipped with a focal plane detector was evaluated. The CID board is an array of 256 x 256 pixels which are 20 x 20 micrometers in dimension. The tracker used for test was a breadboard tracker system developed by BASD. Unique acquisition and tracking algorithms are employed to enhance performance. A pattern recognition process is used to test for proper image spread function and to avoid false acquisition on noise. A very linear, high gain, interpixel transfer function is derived for interpolating star position. The lens used in the tracker has an EFL of 100 mm. The tracker has an FOV of 2.93 degrees resulting in a pixel angular subtense of 41.253 arc sec in each axis. The test procedure used for the program presented a star to the tracker in a circular pattern of positions; the pattern was formed by projecting a simulated star through a rotatable deviation wedge. Further tests determined readout noise. Noise Equivalent Displacement during track, and spatial noise during acquisition by taking related data and reducing it. M.D.K.

HC A02/MF A01 CSCL 21/2

The temporal and radial profiles of particulate mean sizes and densities in the exhaust plume of a pulsed 5-lbf thrust liquid bipropellant rocket engine have been determined. The primary goal of this analysis has been to establish the capability of simulating the characteristics of multi-second firings at high altitude. The results demonstrate that steady-state particle formulation kinetics are achieved in times on the order of 10 milliseconds. Further, combustion instability was shown to be unimportant for combustion chamber length-to-diameter ratios less than 30. The particle size and flux measurements reported here additionally demonstrate the utility of Mie scattering techniques for pulsed engine testing and contamination tests.

HC A03/MF A01 CSCL 11D

The fabrication of boron/aluminum fan blades for the F-404 Supersonic Cruise Research prototype engine by rapid air bonding of fully dense monotapes is described, and the fan blades evaluated. The F-404 configuration is representative of a low aspect ratio advanced design blade with supersonic capability. Dovetail pull tests of this geometry, which substituted boron/aluminum for titanium, suggested that excessive shear stresses were present in the root. A re-designed blade, incorporating a titanium tang and root, was fabricated by hot isostatic pressing. Blades appeared well bonded but the airfoil contained sizable areas of deformation and identification from the alumina grain used as a pressure transmitting medium. The use of hot isostatic pressing with a formed steel encapsulator should eliminate this problem.

HC A06/MF A01 CSCL 11D

A computerized, analytical methodology was developed to study damage accumulation during low velocity lateral impact of layered composite plates. The impact event was modeled as perfectly plastic with complete momentum transfer to the plate structure. A transient dynamic finite element approach was selected to predict the displacement time response of the plate structure. Composite ply and interlaminar stresses were computed at selected time intervals and subsequently evaluated to predict layer and interlaminar damage. The effects of damage on elemental stiffness were then incorporated back into the analysis for subsequent time steps. Damage predicted included fiber failure, matrix ply failure and interlaminar delamination. Author

ENVIRONMENTAL EXPOSURE EFFECTS ON COMPOSITE MATERIALS FOR COMMERCIAL AIRCRAFT Interim Technical Report, Nov. 1977 - Jul. 1981
Martin N. Gibbins and Daniel J. Hoffman Washington NASA Jan. 1982 129 p refs
(Contract NAS1-15148)
(NASA-CR-3502; D6-51227) Avail: NTIS HC A07/MF A01 CSCL 11D

The effects of environmental exposure on composite materials are studied. The environments considered are representative of those experienced by commercial jet aircraft. Initial results have been compiled for the following material systems: T300/5208, T300/5209 and T300/934. Specimens were exposed on the exterior and interior of Boeing 737 airplanes of three airlines, and to continuous ground level exposure at four locations. In addition specimens were exposed in the laboratory to conditions such as: simulated ground-air-ground, weatherometer, and moisture. Residual strength results are presented for specimens exposed for up to two years at three ground level exposure locations and on airplanes from two airlines. Test results are also given for specimens exposed to the laboratory simulated environments. Test results indicate that short beam shear strength is sensitive to environmental exposure and dependent on the level of absorbed moisture. S.L.

PREDICTION OF COMPOSITE HYGRAL BEHAVIOR MADE SIMPLE
Christos C. Chamis and J. H. Sinclair 1982 30 p refs Presented at the 37th Ann. Conf. of the Soc. of the Plastics Ind. (SPI), Washington, D.C., 12-15 Jan. 1982
(NASA-TM-82780; E-1022) Avail: NTIS HC A03/MF A01 CSCL 11D

A convenient procedure is described to determine the hygral behavior (moisture expansion coefficients and moisture stresses) of angleplied fiber composites using a pocket calculator. The procedure consists of equations and appropriate graphs for various (+ or - theta) ply combinations. These graphs present reduced stiffness and moisture expansion coefficients as functions of (+ or - theta) in order to simplify and expedite the use of the equations. The procedure is applicable to all types of balanced, symmetric fiber composites including interply and intraply hybrids. The versatility and generality of the procedure is illustrated using several step-by-step numerical examples. Author

COMPOSITE STRUCTURAL MATERIALS Semiannual Progress Report, 30 Apr. - 30 Sep. 1981
George S. Ansell, Robert G. Loewy, and Stephen E. Wiberly Dec. 1981 164 p refs Sponsored in part by Air Force
(Grant NGL-33-018-003)
(NASA-CR-165121; SAR-41) Avail: NTIS HC A08/MF A01 CSCL 11D

Physical properties of fiber reinforced composites; structural concepts and analysis; manufacturing; reliability; and life prediction are subjects of research conducted to determine the long term integrity of composite aircraft structures under conditions pertinent to service use. Progress is reported in (1) characterizing homogeneity in composite materials; (2) developing methods for analyzing composite materials; (3) studying fatigue in composite materials; (4) determining the temperature and moisture effects on the mechanical properties of laminates; (5) numerically analyzing moisture effects; (6) numerically analyzing the micromechanics of composite fracture; (7) constructing the 727 elevator attachment rib; (8) developing the L-1011 engine drag strut (CAPCOMP 2 program); (9) analyzing mechanical joints in composites; (10) developing computer software; and (11) processing science and technology, with emphasis on the sailplane project. OVERALL EFFECTIVE THERMAL RESISTANCE OF CORRUGATED FIBERBOARD CONTAINERS
David W. Bormett Aug. 1981 13 p refs
(AD-A106569; FSRP-FPL-406) Avail: NTIS HC A02/MF A01 CSCL 13/4

The overall effective thermal resistance of a corrugated fiberboard container was determined as a function of air velocity and board thickness, and an appropriate design curve is presented. The thermal resistance of the container is treated as a sum of resistance, with individual resistance values presented for the interior interfacial contact resistance, the board resistance, and the exterior boundary resistance. Behavioral differences were found for heating versus cooling at conventional board thickness and a possible explanation for this behavior is presented. GRA

EFFECT OF PAPERBOARD STRESS-STRAIN CHARACTERISTICS ON STRENGTH OF SINGLEWALL CORRUGATED FIBERBOARD: A THEORETICAL APPROACH
Thomas J. Urbanik Jul. 1981 18 p refs
(AD-A106566; FSRP-FPL-401) Avail: NTIS HC A02/MF A01 CSCL 11/5

The stress-strain relationship for paperboard loaded in edgewise compression relates to the strength of singlewall corrugated containers. This relationship can be approximated from the paperboard characteristics of stress measured at the maximum load and the initial modulus of elasticity. Based on typical characteristics for both linerboard and corrugating medium material a design matrix is constructed for a factorial analysis. Using a computer, various stress-strain relationships are paired together like they might be on the corrugator, and the theoretical effects of the stress-strain characteristics are investigated. Computer drawn design curves show how these linerboard and medium characteristics affect combined board edgewise compressive strength and box top-to-bottom compressive strength. The interaction between the stress-strain characteristics and paperboard thickness is used to suggest new criteria for evaluating paperboard. Author (GRA)

THERMAL DEGRADATION OF GRAPHITE/EPOXY COMPOSITE Final Report, 16 Apr. 1979 - 30 Sep. 1980
Harold L. Pritt 28 Nov. 1980 70 p refs
(Contract N62269-79-C-0240)
(AD-A106425; NADC-78118-60) Avail: NTIS HC A04/MF A01 CSCL 11/4

The purpose of this effort was to develop visual, NDI, and residual strength correlations as a result of thermal degradation upon thick composite laminates. These investigations were performed upon dry 0.25-inch-thick, coated graphite composite (AS-1/3501-6) laminates subjected to thermal shock on one side. Exposure temperatures were 350 degrees, 400 degrees, 500 degrees, 600 degrees, 800 degrees, 1200 degrees, 1600 degrees, and 1800 degrees F. Temperature gradients were obtained from instrumental panels under no-load conditions. Thermal shocking of panels and specimens while under sustained strain (2500 microns in./in.) conditions provided comparisons of load carrying ability. Other specimens were tested for residual strength after thermal exposure. Ultrasonic examinations were performed, as was monitoring of color changes. Permanent matrix damage began to occur during a 600 degrees F exposure.

NDI OF COMPOSITE MATERIALS
I. G. Scott and C. M. Scala Jul. 1981 30 p refs
(AD-A106278; ARL/MAT-TM-379) Copyright. Avail: Issuing Activity CSCL 11/4

A review is given of NDI methods for fibre-reinforced composite materials such as carbon, boron, glass and KEVLAR. The capabilities of present methods such as ultrasonics, radiography, holography and thermography are evaluated for defect detection. In addition, techniques which show promise of development as predictors of failure, e.g., vibration measurement and acoustic emission, are examined. Author (GRA)

NONLINEAR FINITE ELEMENT ANALYSIS OF SANDWICH COMPOSITES Final Report, Sep. 1977 - Nov. 1980
Robert A. Brockman Wright-Patterson AFB, Ohio AFWAL Mar. 1981 112 p refs
(Contract F33615-77-C-3075; AF Proj. 2401)
(AD-A106378; UDR-TR-80-113; AFWAL-TR-81-3008) Avail: NTIS HC A06/MF A01 CSCL 11/4

Finite element analysis techniques are developed for the solution of nonlinear problems involving sandwich composite materials. Each layer of a sandwich panel is represented explicitly so that multicore panels and other configurations are easily considered. The finite element discretization is performed using arbitrary-shaped, fully compatible shell and continuum elements, as well as special elements representing full-depth and/or face sheet stiffeners. Each of these elements is capable of representing arbitrarily large displacements and rotations, since no simplifying assumptions are made in the theoretical formulation. Elastic-plastic effects may also be considered. An associated computer program is described which may be used to perform linear or nonlinear solutions for mechanical and thermal loading, linear natural frequency calculations. Several example problems are solved to demonstrate the capabilities of the program.

ANALYSIS OF BONDED JOINTS IN COMPOSITE MATERIALS STRUCTURES INVOLVING HYGROTHERMAL EFFECTS Final Report, 1978 - 1979
Jack R. Vinson Apr. 1981 56 p refs
(Contract N00014-78-C-0199)
(AD-A106720; MAE-TR-239) Avail: NTIS HC A04/MF A01 CSCL 11/4

Results of the analyses of stresses, strains and displacements in both the adhesive bond and the adherends of bonded composite material structures and bonded metallic structures are presented. Joint configurations include the single lap, the double lap, the single doubler, the double doubler, and the stepped lap joint. The methods will be useful in designing and analyzing such joints under static, dynamic and thermal loads, as well as accounting for stresses incurred during fabrication as well as hygrothermal histories. Also shown are the effects of important geometric and material parameters on the stress, strain and displacement distributions.

INSTRUCTIONS FOR TI-59 COMBINED CARD/MODULE CALCULATIONS FOR IN-PLANE AND FLEXURAL PROPERTIES OF SYMMETRIC LAMINATES Final Report, May - Jul. 1981
Stephen W. Tsai and Stella D. Gates Sep. 1981 55 p
(AF Proj. 2419)
(AD-A107984; AFWAL-TR-81-4116) Avail: NTIS HC A04/MF A01 CSCL 11/4

This report contains the description and instructions for the combined use of composite materials module and magnetic cards for TI-59 programmable calculators. These programs contain the key calculations of the stiffness and strength of unidirectional and laminated composites. This can include sandwich core laminates. Both in-plane and flexural loadings can be applied. With the combination of the module and magnetic cards, instant calculations can be made for practical use. With the use of a printer, these can be immediately outputted and recorded permanently.

DEPOSITION AND CHARACTERIZATION OF PYROCARBON COATINGS PRODUCED BY USE OF CO2 DILUTION
D. P. Stinton and W. J. Lackey Oct. 1981 17 p refs
(Contract W-7405-eng-26)
(PB82-000900; ORNL/TM-7853) Avail: NTIS HC A02/MF A01 CSCL 11D

A Biso-coated fuel particle for the high temperature gas cooled reactor consists of a 500 micrometers ThO2 kernel, an 85 micrometer layer of low density carbon, and a 75 micrometer layer of high density pyrocarbon. Coatings produced from mixtures of 50% propylene, 25% CO2 and 25% Ar were found to be more gastight than were coatings produced from mixtures of propylene and argon, helium, or H2. Higher concentrations of CO2 in the gas mixture caused severe oxidation of graphite components within the coating furnace. The permeability of coatings deposited by use of CO2 dilution was found to depend on the deposition temperature. Low deposition temperatures produced more gastight coatings. It was determined that CO2 had little or no effect on coating anisotropy.

PREPARATION AND CHARACTERIZATION OF CONDUCTING IRON TUNGSTATES

H. Leiva, K. Dwight, and Aaron Wold 23 Oct. 1981 26 p refs Submitted for publication
(Contract N00014-77-C-0387; NR Proj. 359-653)
(AD-A106541; TR-17) Avail: NTIS HC A03/MF A01 CSCL 07/2

Several iron(III) tungstates have been prepared, and their crystallographic, magnetic, electric and photoelectronic properties have been characterized. The compounds crystallize with the tri-alpha-PbO2 structure, and the actual ordering of the MO6 octahedra (M = Fe or W) appears to determine these properties. Under illumination, Fe2WO6 photoanodes show an intermediate photoresponse between conducting alpha-Fe2O3 and WO3, although the flat-band potential is still too positive.

FEASIBILITY OF INTERFACING A MICROCOMPUTER WITH A MULTICHANNEL ANALYZER TO PERFORM GAMMA RAY SPECTROSCOPY M.S. Thesis

DeFrance Clarke, III Mar. 1981 140 p refs
(AD-A106176; AFIT/GNE/PH/81M-2) Avail: NTIS HC A07/MF A01 CSCL 20/8

Interfacing a microcomputer to a Nuclear Data Series 2200 multichannel analyzer has been demonstrated. Programs for data transfer, peak detection, peak net area integration, peak centroid location, and energy calibration were written. Data transfer and peak detection scan were demonstrated on 4096 channel spectra in less than 5 minutes. Multibyte integer arithmetic routines for the 8080 microprocessor were written to conserve space and time. A proposed system for gamma ray spectrum analysis is described in hardware and software terms. The hardware for the proposed system would cost less than $9000 while commercial multichannel analyzers with the same capabilities would cost in excess of $23,000. GRA

CARBON VAPOR PRESSURE IN THE RANGE 3450 TO 4500 K AND EVIDENCE FOR MELTING AT APPROXIMATELY 3800 K

Arthur G. Whittaker, Paul I. Kinter, L. S. Nelson (Sandia Corp., Albuquerque, N. Mex.), and N. Richardson (Sandia Corp., Albuquerque, N. Mex.) 1 Sep. 1981 57 p refs
(Contract F04701-80-C-0081)
(AD-A106134; TR-0081(6950-02)-1; SD-TR-81-60) Avail: NTIS HC A04/MF A01 CSCL 07/3

The vapor pressure of carbon was determined over the temperature range 3470 to 4490 K by using a laser heating technique. The solid-liquid-vapor triple point was located at approximately 3800 K and a pressure of approximately 13,000 Pa, and the normal boiling point was found to be approximately 4140 K. Evidence for a solid-solid-vapor triple point was found at approximately 3560 K. Liquid carbon was produced in a free state, and some of its properties were determined. Superheated liquid carbon was produced at low pressure by using sufficient laser power. Spectroscopic methods were used to determine the carbon gas temperature and as a cross-check on the temperature determined by an optical pyrometer. Author (GRA)

CONSTRUCTION OF LARGE REACTION MECHANISMS Final Report

D. Indritz, M. Maday, R. Sheinson, and W. Shaub 9 Oct. 1981 30 p refs
(RR0240241)
(AD-A106139; NRL-8498) Avail: NTIS HC A03/MF A01 CSCL 07/4

An algorithm was developed to systematically and objectively generate tractable reaction mechanisms using as input information the species present, and their enthalpies, entropies, number of atoms, and number of bonds. The algorithm generates all possible reactions subject to the constraints of mass balance, energy, entropy, and number of bonds broken and formed. Bimolecular, unimolecular decomposition, addition and isomerization reactions are considered. This method reduces error and still allows for the application of chemical intuition by the researcher. DETERMINATION OF YTTRIUM IN HIGH DENSITY SILICON NITRIDE BY EMISSION AND X-RAY FLUORESCENCE SPECTROSCOPY Final Report

Bernard H. Strauss Aug. 1981 15 p
(AD-A107596; AMMRC-TR-81-39) Avail: NTIS HC A02/MF A01 CSCL 07/4

Two spectrographic methods were developed for the determination of yttrium in high density yttrium-doped silicon nitride. The first method employs emission spectrographic techniques which compares a solution of the dissolved sample with that of aqueous synthetic standards. The second method uses energy dispersive X-ray fluorescence techniques to compare fusion buttons made from the samples with those fabricated from pure yttria and undensified silicon nitride. Synthetic standards were required in both methods because there were no available yttrium-densified silicon nitride standards. Seven samples were analyzed whose yttrium content ranged from two to sixteen weight percent. Data on results are furnished. GRA

IDENTIFICATION OF SYNTHETIC FLUIDS UTILIZING PYROLYSIS GAS LIQUID CHROMATOGRAPHIC TECHNIQUES Final Report

Robert G. Jamison Sep. 1981 47 p refs
(AD-A108117; MERADCOM-2340) Avail: NTIS HC A03/MF A01 CSCL 11/8

Because of the increasing use of synthetic-based lubricants and functional fluids, a study was initiated to develop a rapid gas liquid phase chromatographic method that would enable qualitative identification of differing types of base stock ingredients. Results of this investigation revealed that by utilizing pyrolysis gas liquid-phase chromatographic techniques, identification of many different types of materials can be successfully accomplished in a relatively short period of time. Utilization of this technology will greatly enhance the resolution of field problems and permit a greater understanding of fluid and lubricant research.

APPLICATIONS OF DHDECMP EXTRACTION CHROMATOGRAPHY TO NUCLEAR ANALYTICAL CHEMISTRY

S. F. Marsh and O. R. Simi 1981 10 p refs Presented at the 25th Conf. on Anal. Chem. in Energy Technol., Gatlinburg, Tenn., 6-8 Oct. 1981
(Contract W-7405-eng-36)
(DE81-030134; LA-UR-81-2533; CONF-811025-1) Avail: NTIS HC A02/MF A01

Dihexyl-N,N-diethylcarbamyl methylene phosphonate (DHDECMP) is a highly selective extractant for actimides and lanthanides. This reagent, extensively studied for process-scale operations, also has valuable analytical applications. Extraction chromatographic columns of DHDECMP, supported on inert, porous, polymer beads effectively separate most metallic impurity elements from the retained transition elements. The retained elements can be separated into individual fractions of lanthanides, americium, plutonium, and uranium by mixed-solvent anion exchange.

FLAME INHIBITION BY METHYL BROMIDE

Charles K. Westbrook 27 Aug. 1981 34 p refs Presented at Western States Sec. of the Combust. Inst., Tempe, Ariz., 19-20 Oct. 1981 Submitted for publication
(Contract W-7405-eng-48)
(DE81-030995; UCRL-86456; CONF-811041-1) Avail: NTIS HC A03/MF A01

A numerical flame model is used to investigate the inhibition of laminar hydrocarbon-air and hydrocarbon-oxygen flames by methyl bromide. The detailed kinetic mechanism consists of 97 elementary reactions involving 30 chemical species and is based on a previous model for flame inhibition by HBr to which have been added reactions in which Br atoms are abstracted from CH3Br. The resulting mechanism is validated by comparison between experimental data on low pressure CH4-O2-CH3Br flames. Subsequently, the model is used to predict the response of a series of fuel-air mixtures to the addition of varying amounts of CH3Br. Fuels considered include methane, methanol, and ethylene. It is found that the inhibition efficiency depends on fuel-air equivalence ratio, pressure and fuel type. The kinetic factors responsible for this behavior are discussed in detail. DOE

EXPERIMENTAL WORK RELATED TO TWO BISMUTH SULFATE CYCLES AND THEIR POSSIBLE IMPROVEMENT. OUTLINE OF A POSSIBLE ANTIMONYL SULFATE CYCLE WITH SEPARATE EVOLUTION OF SULFUR DIOXIDE AND OXYGEN

Wesley M. Jones 1981 10 p refs Presented at the 4th Tech. Workshop (Task 1), Thermochem. Processes, Juelich, West Germany, 23-25 Sep. 1981 Submitted for publication
(Contract W-7405-eng-36)
(DE81-030236; LA-UR-81-2627; CONF-810942-4) Avail: NTIS HC A02/MF A01

The key reactions of both cycles are listed. Cycle 1 proceeds through the intermediate oxysulfates Bi2O2(SO4)2 and Bi2O2SO4 and Cycle 2 through Bi2O2SO4. Cycle 1 has the advantage of generating 2.3 moles of H2 per mole of Bi2O3, compared with 1.3 for Cycle 2. The efficiency for electrochemical formation of H2SO4 and H2 seems at present to be a maximum at around 30 wt% H2SO4. Thermodynamic data obtained for the decomposition reactions are presented. A possible improvement in these cycles is discussed which may provide a solution to a problem of sorption of H2SO4 solution by the solids and might allow use of a more dilute acid than in Cycle 1 above. A brief discussion on the possible simplification of the SO3-SO2-O2 separation problem with a sulfuric acid-antimonly sulfate hybrid cycle is presented.

SURFACE STUDIES OF PLASTIC-BONDED PETN AND RDX BY X-RAY PHOTOELECTRON SPECTROSCOPY (XPS) AND ION-SCATTERING SPECTROSCOPY (ISS)

P. S. Wang, W. E. Moddeman, L. D. Haws, T. N. Wittberg (Dayton Univ.), and J. A. Peters (Dayton Univ.) 1981 25 p refs Presented at 11th Symp. on Explosives and Pyrotech., Philadelphia, 15 Sep. 1981
(Contract DE-AC04-76DP-00053)
(DE81-030402; MLM-2860-OP; CONF-810926-5) Avail: NTIS HC A02/MF A01

Surface structures of plastic bonded PETN and RDX were studied by high resolution X-ray Photoelectrons Spectroscopy (XPS) and Ion Scattering Spectroscopy (ISS). The coating material is a copolymer of vinyl chloride and chlorotrifluoroethylene. Specimens with 6 wt % of the coating on RDX and 4 wt % on PETN were used in these studies. High resolution elemented XPS spectra of F 1s, N 1s, C 1s, and Cl 2p indicate that the surface of coated RDX (PBX-9407) is covered and the coating film is thicker than 100A; the results with coated PETN (LX-16) show the surface layer to be thinner than 100A. He(+) ISS data on LX-16 suggest that the coating on PETN is not uniform and is, in fact, absent in some regions.

SMALL UNILAMELLAR VESICLES AS REAGENTS: A CHEMICALLY DEFINED QUANTITATIVE ASSAY FOR LECTINS

Robert K. Rando 1981 17 p refs
(Contract DE-AC02-79EV-10208)
(DE81-030365; DOE/EV-10268/2) Avail: NTIS HC A02/MF A01

Small unilamellar vesicles containing synthetic glycolipids can be prepared. These vesicles are aggregated by the appropriate lectin (Orr et al., 1979; Rando and Bangerter, 1979; Slama and Rando, 1980). It is shown here that extent of aggregation of these vesicles as measured by light scattering at 360 nm, is, under certain conditions, linear with amount of lectin added. This forms the basis of a rapid and simple quantitative assay for lectins using the modified vesicles as a defined chemical substrate. The assay is sensitive to lectin concentrations in the low microgram range. The assay is applied here to studies on concanavalin A, Ricinus communis agglutinin and the alpha fucosyl binding lectin from Ulex europaeus (Type I). DOE

STUDY OF THE SECONDARY Li ELECTRODE IN ORGANIC ELECTROLYTE Final Report, 15 Jun. 1980 - 28 Feb. 1981

M. Eisenberg Apr. 1981 45 p refs Prepared for California Univ., Berkeley. Lawrence Berkeley Lab.
(Contract W-7405-eng-48)
(DE82-001506; LBL-13263) Avail: NTIS HC A03/MF A01

The objective of this eight month program was a preliminary Phase I study of the electrochemical and morphology aspects of lithium anode rechargeability in organic electrolyte ambient temperature systems. It is now increasingly recognized that the limitation of lithium anode rechargeability may have a serious effect on the future development and capabilities of ambient temperature high energy secondary lithium batteries. To provide a basis for future reliable evaluation of electrolyte systems, it was necessary to examine the technique of stripping efficiency studies for lithium with particular reference to the effect of substrates, amount of charge passed, current density and other conditions. Next was a development of a technique for lithium electrode preparation for electrodeposition for scanning electron microscopy (SEM) studies. With these techniques, a number of basic electrolyte systems were examined in order to elucidate directions in which future efforts in this area should be made. DOE

FLASH HYDROPYROLYSIS OF WESTERN KENTUCKY NO. 9 BITUMINOUS COAL WITH CATALYST Final Technical Progress Report

31 Mar. 1981 254 p refs
(Contract DE-AC22-79ET-14943)
(DE81-029631; DOE/ET-14943/T1) Avail: NTIS HC A12/MF A01

The effects of selected catalysts on liquefaction of caking and noncaking pulverized coals were investigated. With caking coals, the free fall flash hydropyrolysis reactor operated satisfactorily between temperatures of 1250 to 1550 F and between 900 to 950 F with and without catalyst additions. Noncaking coals could be treated at all ranges of temperatures with or without catalyst additions. Up to two pounds per hour of coal and four pounds per hour of hydrogen were fed into the reactor. Of the catalysts tested, zinc chloride proved most effective, but only at low temperature of about 900 F. At temperatures of 1250 to 1450 F, zinc chloride, as well as other catalysts, proved to be ineffective. At 1400 to 1450 F and 1000 psig with 0.5 seconds solids residence time, about 47 percent of the carbon in caking coals were converted into useful gas and liquid products: 10 percent BTX, 7 percent light oil, 10 percent heavy oil, 27 percent total oil, 12 percent methane, 8 percent ethane, and 20 percent total gas. DEVELOPMENT OF POTENTIAL USES FOR THE RESIDUE FROM FLUIDIZED-BED-COMBUSTION PROCESSES Quarterly Technical Progress Report, Mar. - May 1981

L. John Minnick 1981 30 p
(Contract DE-AC21-77ET-10415)
(DE81-030157; DOE/ET-10415/T4) Avail: NTIS HC A03/MF A01

Evaluation of the solid wastes from fluidized bed combustion for potential commercial uses is described. Methods by which the material can be safely disposed of should commercial applications be slow in developing were explored. It was shown that spent bed materials from atmospheric fluidized bed (AFB) boilers are potentially useful in a number of commercial applications. AFB residue materials from different sources do contain a substantial component of reactive lime which can, after proper processing, be concentrated and effectively separated from the residue. Spent bed materials also exhibit unusual cementitious properties when used as received or after processing in certain construction related compositions. Evaluation of a number of different sources of AFB residue in the following areas of research was emphasized in the study: (1) characterization of AFB by-product materials; (2) determination of most effective means of beneficiation or separation of materials; (3) laboratory evaluation of the feasibility for use of AFB residue in such applications as a lime substitute, neutralization of acidic trade wastes, flue gas desulfurization, and the stabilization of highly plastic soils; and (4) performance testing of commercial applications involving some cementitious activity. CATALYTIC HYDROGENATION OF COAL-DERIVED LIQUIDS Interim Report, Jun. - Aug. 1981

L. Berg Sep. 1981 37 p
(Contract DE-AC22-76ET-10495)
(DE82-003250; DOE/ET-10495/T3) Avail: NTIS HC A03/MF A01

The development of special catalysts to convert SRC-II into a feedstock acceptable to a conventional petroleum refinery proceeded with the carrying out of several long cycle runs. A catalyst comprising 4% CoO, 8% MoO3, 1% NiO and 6% WO3 on NALCO base 78-6008 was operated for 102 hours with burnoffs and resulfiding every three hours. The same catalyst was operated for 104 hours with regeneration every eight hours. This catalyst was then operated for runs of 60, 100 and 300 hours with no burnoff. Harshaw's HT400 with 15% MoO3 and 3% coO was operated for a single cycle of 165 hours before cogeneration. These runs produced typically liquid yields of 90 to 100 vol. %, < 0.3 wt. % N2 and < 0.3 wt. % S in the product, and a yield of 45% of 40 to 2050 C gasoline prossessing octane numbers of 75.1 MON, 88.3 RON, 81.7 (R+M)/2. A study of regeneration via burnoff and resulfiding showed a slight reduction in the size of the pores of the catalyst. Catalysts were prepared by impregnating 4% coO, 2% MoO3 and 2% WO3 on seven different bases having pore diameters ranging from 90A to 420A. These catalysts as well as the unimpregnated bases were evaluated for denitrogenation ability with SRC-II. Preliminary results point to the 220A pore diameter as the best compromise between diffusion limitation and reduction in surface area. DOE

CHARACTERISTICS OF COAL/LIGHT HYDROCARBON SLURRIES IN SPRAY COMBUSTION Semiannual Progress Report, 1 Mar. - 31 Aug. 1981

W. L. Grosshandler, Clayton T. Crowe, and Jacob N. Chung Sep. 1981 23 p refs
(Contract DE-FG22-80PC-30216)
(DE82-000387; DOE/PC-30216/T2) Avail: NTIS HC A02/MF A01

The status of the atomization process, recirculation within the droplet, and the combustion of coal/vaporized fuel in a diffusion burner is discussed. The droplet spray apparatus was completed and checked out for mixing effectiveness and spray uniformity. Initial runs with pure methanol were completed. Preliminary tests were run with slurries composed of 15% and 30% mixtures of coal in liquid with mean particle sizes of 50 and 150 (Sigma)m. Analysis of the data shows small increases in Sauter mean diameter due to the presence of coal particles. The equations of motion for coal particles translating inside a circulating light hydrocarbon were developed. A computer program has been written to solve for the particle motion numerically. Particle trajectories and general distribution patterns are predicted. The combustion facility was designed and built. Initial testing to assess the stability and flatness of the reaction zone is described. Both a spouted bed and fluidized bed feeder were built to control the mass flow of coal to the burner, and the stability and flow rate of each are being assessed. DOE

DEVELOPMENT OF A PARTICLE COLLECTOR FOR ABSOLUTE MEASUREMENTS OF PARTICLE FORM, PARTICLE SIZE AND PARTICLE CONCENTRATION Final Report, Aug. 1979
Rolf Kleine and Siegbert Bittighofer Bonn Bundesministerium fuer Forschung und Technologie Feb. 1981 54 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-029; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 9.90

A particle collector system in which the collecting element is constituted by copper oxide whiskers grown on fine meshed and highly transparent bronze wire grids was developed. An absolute determination of size and shape is provided By electron microscope imagery of the meshes onto which liquid droplets or solid particles adhesively stick. The whisker growing technique and the automated picture analysis method are described. Section probes and pump units were developed for isokinetic sampling. It is indicated that the whisker collectors are suited for analyzing fine aerosols below 1 micron and that they can be used for absolute calibration of optical particulate sampling instruments.

SMOLDERING COMBUSTION HAZARDS OF THERMAL INSULATION MATERIALS Interim Report, 1 Oct. 1979 - 30 Apr. 1981
T. J. Ohlemiller Aug. 1981 69 p refs Sponsored in part by ORNL, Tenn.
(PB82-107046; NBSIR-81-2350) Avail: NTIS HC A04/MF A01 CSCL 13M

The smoldering combustion hazards of cellulosic loose fill insulation materials (smolder initiation, smolder propagation and transition from smoldering into flaming) were investigated. An improved smolder ignition test method is being designed to give ignition temperatures comparable to those in practice. The test method requires checking against full-scale mock-up results before implementation. Analysis of experimental profiles for temperature, oxygen level, and remaining organic fraction strongly indicate that the smolder wave is oxygen supply controlled and involves both first and second stages of oxidative heat release from the insulation material. Efforts to develop improved means of suppressing smolder propagation should be directed at the entire oxidation process.

EFFECTS OF ENVIRONMENTAL VARIABLES ON THE CRACK INITIATION STAGES OF CORROSION FATIGUE OF HIGH STRENGTH ALUMINUM ALLOYS Final Report
Laurence E. Poteat 18 Dec. 1981 26 p refs
(Grant NsG-1283)
(NASA-CR-165115) Avail: NTIS HC A03/MF A01 CSCL 11F

Fatigue initiation in six aluminum alloys used in the aircraft industry was investigated. Cyclic loading superimposed on a constant stress was alternated with atmospheric corrosion. Tests made at different stress levels revealed that a residual stress as low as 39% of the yield strength caused stress corrosion cracking in some of the alloys. An atmospheric corrosion rate meter developed to measure the corrosivity of the atmosphere is described. An easily duplicated hole in the square test specimen with a self-induced residual stress was developed.

Research related to the characterization of microstructures of various metallic and nonmetallic materials is summarized. Metals included aluminum alloys, titanium alloys, nickel-base superalloys, nonmetallics such as graphite fibers and polymers, titanium matrix composites and ceramics (TiC, sialons). Techniques employed were various types of electron microscopy (TEM, SEM, EPMA), optical microscopy, quantitative metallography, and various heat treatments. Improvements in techniques were made in each method applied. Major subprojects included characterization of titanium powders, examination of Ti-5Al-2.5Sn PM alloy, formulation of a color micrograph method for titanium-hydride determination, and use of new microcomputer methods for stereological analyses of microstructures. The Materials Characterization Facility is described in terms of the physical plant and the methods of operation used in accomplishing the research on microstructures.

AN EXPERIMENTAL EVALUATION OF TEARING INSTABILITY USING THE COMPACT SPECIMEN Final Report
Michael G. Vassilaros and James A. Joyce Nov. 1981 30 p refs
(AD-A107633; DTNSRDC-81/029) Avail: NTIS HC A03/MF A01 CSCL 20/11

The objective of this investigation was to produce experimental verification of the tearing instability theory proposed by Paris and coworkers. This theory states that ductile crack extension will occur in an unstable fashion whenever the applied tearing force is greater than the material tearing resistance. In this investigation, a series of compact specimens of aluminum, titanium, and steel alloys were tested in a variably compliant test machine to generate a range of applied tearing forces. The material tearing resistance was measured from the JI-R curves of the stable specimens and compared to the applied tearing force necessary to generate ductile tearing instability in each material. The Paris theory was found to accurately predict the onset of gross instability behavior. Some limited instability behavior was found, however, at values of tearing force less than the average material tearing resistance obtained from an unloading compliance JI-R curve test. Limited instability behavior was characterized by repeated short steps of rapid but ductile crack extension, separated by regions of slow stable tearing.

SWELLING AND MICROSTRUCTURE OF HFIR IRRADIATED AUSTENITIC STAINLESS STEELS
P. J. Maziasz 1980 16 p Presented at the ADIP Program Rev. Meeting, Germantown, Md., 30 Sep. - 1 Oct. 1980
(Contract W-7405-eng-26)
(DE82-000158; CONF-8009179-3) Avail: NTIS HC A02/MF A01

The swelling and microstructural information available from HFIR-CTRs-9-13 are summarized and compared for CW 316 and CW(316 + Ti). These experiments were irradiated to moderate fluences of about 8 to 16 dpa and 500 to 1000 at. ppM He at irradiation temperatures ranging from 285 to 670 C. The results are compared to higher fluence HFIR irradiation of CW 316 from HFIR-CTRs-2-8 irradiated at 375 to 680 C at fluences up to 61 dpa and 4200 at. ppM He. Both the high- and low-fluence cavity volume fraction swelling curves for CW 316 have a similar shape. The curves show a definite swelling minimum at 470 to

570 C that corresponds to the temperature of maximum precipitation. The swelling increases rather sharply with temperature at the higher and lower temperatures. The moderate fluence swelling levels are all below 0.5% Delta V/V sub o.DOE

RESISTANCE OF (Fe,Ni)SUB3V LONG-RANGE-ORDERED ALLOYS TO RADIATION DAMAGE

D. N. Braski 1980 18 p Presented at the ADIP Program Rev. Meeting, Germantown, Md., 30 Sep. - 1 Oct. 1980
(Contract W-7405-eng-26)
(DE81-032006; CONF-8009179-5; ORNL/DWG-80-17709) Avail: NTIS HC A02/MF A01

The (Fe,Ni)3V long-range-ordered (LRO) alloys being developed for possible application as a first-wall material for a fusion reactor are considered. Alloys with different Fe/Ni ratios were screened to their resistance to radiation by irradiating them with 4 MeV Ni ions to 70 dpa at temperatures from 525 to 680 C. Helium (8 at ppM/dpa) and deuterium ions (28 at ppM/dpa) were simultaneously injected to better simulate fusion reactor conditions. Alloy LRO-16 (31 wt% Ni) contained sigma phase and showed swelling behavior similar to the 20% cold-worked 316 stainless steel that was used as an internal standard. Alloy LRO-20 (39.5 wt% Ni), without sigma phase, swelled slightly less than the 316 stainless steel. Both alloys demonstrated noticeably lower swelling behavior when their composition was changed to include 0.4 wt% Ti. DOE

INFLUENCE OF IRRADIATION ON THE TENSILE PROPERTIES OF AUSTENITIC STAINLESS STEEL WELDMENTS

F. W. Wiffen, D. P. Edmonds, J. A. Horak, and J. F. King 1980 17 p Presented at the ADIP Program Rev. Meeting Mater. and Radiation Effects Branch, Germantown, Md., 30 Sep. - 1 Oct. 1980
(Contract W-7405-eng-36)
(DE81-032002; CONF-8009179-6) Avail: NTIS HC A02/MF A01

Weldments in the first wall and front sections of the blanket of a fusion reactor will be exposed to approximately the same operating conditions as will the base metal. Thus the irradiation response of weld metal, of the weld heat affected zones in the base metal, and of the base metal are all of equal concern. Austenitic stainless steels will most likely be joined by a gas tungsten arc welding process. Welds were made by this process between sections of 6-mm-thick (0.25 in.) base plate of type 316 in the 20%-cold-worked condition, with either type 316 or 16-8-2 stainless steel filler metal. Rod tensile specimens were cut through the welds, containing weld metal in the central gage portion. Weld-containing tensile specimens were irradiated at 55 C and throughout the temperature range 280 to 620 C. The displacement damage levels range from 4.5 to 12.1 dppa, and the helium generation from the thermal neutron captures in nickel resulted in 100 to 550 at ppM He. DOE

VOID SWELLING IN THE MOLYBDENUM ALLOY TZM IRRADIATED TO HIGH FLUENCES

D. S. Gelles, D. T. Peterson, and J. F. Bates 1981 6 p refs Presented at the Fusion Reactor Mater. Meeting, Seattle, 9-12 Aug. 1981
(Contract DE-AC14-76FF-02170)
(DE81-029802; HEDL-SA-2336-FP; CONF-810831-41) Avail: NTIS HC A02/MF A01

Microstructural development and density change measurements are reported for TZM, a commercial molybdenum base alloy, following fast neutron irradiation in EBR-2 to high fluence over the temperature range 400 C to 650 C. Uniformly distributed voids arrayed in a lattice and constituting 3% swelling were observed following irradiation at 650 C to 14.7 x 10 to the 22nd power n/sq cm (E > 0.1 MeV) (53 dpa). Nonuniformly distributed rafts of voids in lattice arrays were observed following irradiation at 540 C to 13.6 x 10 to the 22nd power n/sq cm Void swelling was not resolved following irradiation at 425 C to 12.2 x 10 to the 22nd power n/sq cm. Void swelling measurements corroborated density change results which showed peak void swelling behavior saturating at 590 C. Two mechanisms for the behavior observed are considered. DOE

FRACTURE TOUGHNESS TESTING ON FERRITIC ALLOYS USING THE ELECTROPOTENTIAL TECHNIQUE

F. H. Huang and G. L. Wire 11 Jun. 1981 19 p refs Presented at Fusion Reactor Mater. Meeting, Seattle, 9-12 Aug. 1981
(Contract DE-AC14-76FF-02170)
(DE81-029776; HEDL-SA-2474-FP; CONF-810831-43) Avail: NTIS HC A02/MF A01

Fracture toughness measurments as done conventionally require large specimens (5 x 5 x 2.5 cm) which would be prohibitively expensive to irradiate over the fluence and temperature ranges required for first wall design. To overcome this difficulty a single specimen technique for J integral fracture toughness measurements on miniature specimens (1.6 cm OD x 0.25 cm thick) was developed. Comparisons with specimens three times as thick show that the derived J sub Ic is constant, validating the specimen for first wall applications. The electropotential technique was used to obtain continuous crack extension measurements, allowing a ductile fracture resistance curve to be constructed from a single specimen. The irradiation test volume required for fracture toughness measurements using both miniature specimens and single specimen J measurements was reduced a factor of 320, making it possible to perform a systematic exploration or irradiation temperature and dose variables as required for qualification of HT-9 and 9Cr-1Mo base metal and welds for first wall application. Fracture toughness test results for HT-9 and 9Cr-1 Mo from 25 to 539 C are presented to illustrate the single specimen technique. DOE

EFFECT OF MICROSTRUCTURE ON THE MECHANICAL PROPERTIES OF A COMMERCIAL 12Cr-1Mo STEEL (HT-9)

Thomas A. Lechtenberg Aug. 1981 6 p refs Presented at Fusion Reactor Mater. Meeting, Seattle, 9-12 Aug. 1981 Submitted for publication
(Contract DE-AT03-76ET-51011; GA Proj. 3235)
(DE82-000082; GA-A-16339; CONF-810831-57) Avail: NTIS HC A02/MF A01

The microstructure of a commercial 12CR1Mo steel (HT-9) and its associated effect on strength and toughness properties is studied in order to qualify the alloy for use in fusion energy machines. Interim results show this alloy is subject to a degree of tempered martensite embrittlement and temper embrittlement. For applications projected for fusion machines at lower temperatures, a heat treatment (1000 C, 1 h, air cooled followed by 650 C tempering) at lower temperatures and is shorter times than the vendor recommended heat treatment is identified. Microstructural differences between the treatments are discussed, and mechanical properties are correlated. DOE

CREVICE CORROSION AND METAL-ION CONCENTRATION CELL-CORROSION RESISTANCE OF CANDIDATE MATERIALS FOR OTEC HEAT EXCHANGERS, PARTS 1 AND 2

R. M. Kain May 1981 92 p refs Prepared for Argonne National Lab.
(Contract W-31-109-eng-38)
(DE82-000909; ANL/OTEC-BCM-022) Avail: NTIS HC A05/MF A01

Two separate studies are reported. In the first, titanium, stainless alloy AL-6X, Alclad 3003, aluminum alloy 5052, C70600, C72200 and Cu-10Ni-8Sn sheet materials were exposed to ambient temperature, low velocity seawater for 6 months and crevice corrosion and metal-ion concentration cell corrosion evaluations were conducted. Conditions were sufficiently critical to initiate crevice crack attack on control samples of Type 316 stainless steel. While no evidence of corrosion was detected for titanium and AL-6X, the five aluminum and copper base alloys all exhibited varying degrees of general and/or localized attack. In the second study, laboratory tests in low velocity, filtered seawater at 300 C resulted in initiation of crevice attack for 12 of the 13 stainless alloys included in the evaluation. For the most part, evidence of crevice corrosion initiation was detected within the first 30 days of exposure, although considerable variation in the observed time to initiation of crevice corrosion was noted. DEVELOPMENT AND APPLICATION OF ANALYTICAL TECHNIQUES TO CHEMISTRY OF DONOR SOLVENT LIQUEFACTION Quarterly Progress Report, Jul. - Sep. 1981

H. C. Dorn and L. T. Taylor Oct. 1981 29 p refs
(Contract DE-AC02-89PC-30041)
(DE82-001076; DOE/PC-30041/T7) Avail: NTIS HC A03/MF A01

The quantitation and speciation of organically bound trace metals in coal liquefaction soluble products presents a real challenge. Quantitation methods have been minimal and have involved single element analysis via atomic absorption spectrometry (AAS) or multi-element analysis via inductively coupled plasma atomic emission spectrometry (ICP-AES) both on acid digested aqueous-based matrices. These methods have not proven highly satisfactory because acid digestion introduces, in some cases, a substantial blank value, requires a great amount of time and in the AAS case provides for only single element determinations with mandatory background correction. Elimination of the sample step preparation coupled with use of ICP-AES seems highly attractive for trace multielement quantitative analysis of coal liquefaction products. We have recently established the capability for metal detection in an organic matrix. DOE

ELECTROREFINING OF ALUMINUM

J. Paul Pemsler and Michael Dempsey 1 Apr. 1981 25 p refs
(Grant NSF DAR-80-09300)
(PB81-243693; NSF/CPE-81012) Avail: NTIS HC A02/MF A01 CSCL 11F

An inexpensive, energy-efficient approach to the electrorefining of contaminated aluminum scrap to a product suitable for recycle to wrought alloys was investigated. The method uses a low temperature aluminum chloride, sodium chloride electrolyte with stable organic additives to promote a dense, adherent solid aluminum electrodeposit. The organic leveling agent also permits electrodeposition at current densities two or three times greater than without the additive. Aluminum alloy samples containing magnesium, silicon, copper, chromium, and iron were electrorefined in the low temperature molten salt with additive to produce aluminum of high purity. Author

Flame retardant, abrasion resistant elastomeric compositions are comprised of thermoplastic polyurethane polymer and flame retarding amounts of a filler selected from decabromodiphenyloxide and antimony oxide in a 3:1 weight ratio, and decabromodiphenyloxide, antimony oxide, and ammonium polyphosphate in a 3:1:3 weight ratio respectively. Coated fabrics employing such elastomeric compositions as coating film are flexible, lightweight, and air impermeable and can be made using heat or dielectric sealing procedures.

TRIBOLOGICAL CHARACTERISTICS OF A COMPOSITE TOTAL-SURFACE HIP REPLACEMENT Final Report
William R. Jones, Jr., Jack C. Roberts (Rensselaer Polytechnic Inst.), and Frederick F. Ling (Rensselaer Polytechnic Inst.) Washington NASA Jan. 1982 17 p refs Presented at the ASME-ASLE Joint Lubrication Conf., New Orleans, 5-7 Oct. 1981
(NASA-TP-1853; E-709) Avail: NTIS HC A02/MF A01 CSCL 11H

Continuous fiber, woven E glass composite femoral shells having the same elastic properties as bone were fabricated. The shells were then encrusted with filled epoxy wear resistant coatings and run dry against ultrahigh molecular weight polyethylene acetabular cups in 42,000 and 250,000 cycle wear tests on a total hip simulator. The tribological characteristics of these continuous fiber particulate composite femoral shells articulating with ultrahigh molecular weight polyethylene acetabular cups were comparable to those of a vitallium ball articulating with an ultrahigh molecular weight polyethylene acetabular cup. BEHAVIOR OF CONSTRUCTION ADHESIVES UNDER LONG-TERM LOAD
Bryan H. River and Robert H. Gillespie Jun. 1981 17 p refs (AD-A106565; FSRP-FPL-400) Avail: NTIS HC A02/MF A01 CSCL 11/1

Six construction adhesives and a conventional polyvinyl acetate adhesive were placed under dead load at five stress levels and three temperatures for 2 months. The shear slip was measured after 10, 100, 1,000, 10,000, and 100,000 minutes (70 days) under load. The results show four general types of behavior. Three construction adhesives with crosslinking capability had fair resistance to creep and showed evidence that a creep limit might be reached under moderate dead load and environmental conditions. Two adhesives had very poor creep resistance and failed under moderate dead load and environmental conditions. The sixth adhesive was extremely flexible but with excellent recovery capability. A polyvinyl acetate adhesive was not observed to creep under the low humidity conditions of this study. Adhesives showing evidence of a creep limit may be useful for long-term design loads, but further study of their behavior, especially under varying moisture conditions, is required. Author (GRA)

MECHANICAL PROPERTIES OF ADHESIVELY BONDED ALUMINUM STRUCTURES PROTECTED WITH HYDRATED INHIBITORS Progress Report, 1 Jul. 1980 - 30 Jun. 1981
J. S. Ahearn, G. D. Davis, A. Desai, and J. D. Venables 1 Oct. 1981 39 p refs
(Contract N00014-80-C-0718)
(AD-A106222; MML-TR-81-46C) Avail: NTIS HC A03/MF A01 CSCL 11/1

Research has shown that the adsorbed monolayer inhibitor films that slow the conversion of Al-oxide to hydroxide substantially improve the bond durability of 2024Al adherends prepared with the Forest Products Laboratory process (FPL). An inhibitor coating of nitrilotris (methylene) phosphonic acid produced a bond durability in adherends prepared with the FPL process. As determined by X-ray photoelectron spectroscopy, the inhibitor coverage needed to produce the maximum improvement in bond durability was approximately one monolayer. Results suggest that a compound's effectiveness in improving bond durability of adherends prepared with the FPL process depends on both its ability to inhibit the conversion of Al-oxide to hydroxide and to form chemical bonds with the adhesive. A FINITE ELEMENT MODEL OF A WHITE-METZNER VISCOELASTIC POLYMER EXTRUDATE M.S. Thesis - MIT
Brent R. Collins Feb. 1981 135 p refs
(AD-A106740; AFIT-CI-81-31T) Avail: NTIS HC A07/MF A01 CSCL 20/11

A finite element model of a viscoelastic polymer melt characterized by a White-Metzner rheological equation of state was developed. For creeping flow wherein the inertia terms are negligible non-linear finite element equations were solved by a method of direct substitution termed Picard iteration. Four flow geometries were examined: cross channel, plane couette, entry, and step flow. A comparison of two bi-quadradic isoparametric element types (8 node 'serendipity' and 9 node 'Lagrange') showed general superior behavior of the Lagrange elements. The 'penalty' method of incompressible flow was used with the Galerkin method to formulate the finite element equation, yielding satisfactory behavior for creeping inelastic and viscoelastic flow. The non-linear equations yielded numerical convergence up to Weissenberg numbers of 0.01. Techniques of expanding this radius of convergence were examined and proposed for future effort. PIEZOELECTRIC PVF2 POLYMER FILMS AND DEVICES Final Report, 1 Aug. 1977 - 31 Jan. 1981
D. G. Weinstein and H. J. Shaw Nov. 1981 130 p refs
(Contract N00014-77-C-0582; NR Proj. 384-925)
(AD-A107642; GL-3355) Avail: NTIS HC A07/MF A01 CSCL 20/3

Acoustic transducers and imaging arrays using PVF2 piezoelectric film as the active element have been extensively explored. Thin disk PVF2 bulk wave transducers were experimentally developed and studied using a computer model. Aspects of transducer behavior studied include bandwidth, impulse response, insertion loss, internal loss, impedance matching, and angular response. A monolithic multielement PVF2 transducer array is described which uses photolithographic techniques to achieve a reproducible, inexpensive and highly accurate integrated device for ultrasonic imaging applications. This array was used to produce an electronically focused and scanned acoustic beam. Two dimensional acoustic images of small test objects were performed, to investigate the beam shape and imaging characteristics, which were found to be consistent with theoretical predictions. At a frequency of 2.25 MHz and an f/number of 5, a resolution in the range of 3 mm was observed. Author (GRA)

PROCESS FOR THE FORMATION OF BIAXIALLY ORIENTED FILMS OF POLY(P-PHENYLENE TEREPHTHALAMIDE) (PPD-T) FROM LIQUID CRYSTALLINE SOLUTIONS Technical Report, 1 Jan. 1980 - 15 Sep. 1981
John E. Flood, James L. White, and John F. Fellers 12 Nov. 1981 44 p refs
(Contract N00014-77-C-0236)
(AD-A108058; PATRA-176; TR-6) Avail: NTIS HC A03/MF A01 CSCL 11/9

A new process for making equal biaxially oriented films from liquid crystalline solutions of poly (p-phenylene terephthalamide) (PPD-T) is described. The process involves extruding solutions of PPD-T/H2SO4 through an annular die and over an oil coated mandrel into a coagulation bath. The films were studied using wide angle X-ray diffraction (WAXS) and scanning electron microscopy (SEM). Tensile stress-strain properties were obtained on samples cut at various directions in the plane of the film. Biaxially oriented films were produced which possess equal properties in the various directions in the plane of the film. GRA

STUDIES OF THE EFFECT OF ORIENTATION ON THE ELASTIC CONSTANTS OF STRETCHED AND HYDROSTATICALLY EXTRUDED POLY(CHLOROTRIFLOUROETHYLENE): A MODEL OF AFFINE ORIENTATION IN SEMI-CRYSTALLINE POLYMERS
D. B. Cavanaugh and C. H. Wang 13 Nov. 1981 35 p refs
(Contract N00014-79-C-0507)
(AD-A107909; TR-7) Avail: NTIS HC A03/MF A01 CSCL 11/9

A model of affine orientation of polymer solids is given. The solid is described as a collection of small, orientable units. The elastic constants of the oriented polymer are given as a combination of the elastic constants of the orientable units and of the orientation parameters (P sub 2(cos Theta)) and (P sub 4 (cos Theta)). The elastic constants of stretched and hydrostatically extruded samples of poly (chlorotriflouroethylene) are obtained with Brillouin light scattering. These are fitted to the model and the orientation parameters are calculated. The elastic constants from the extruded samples are fit well by the model but the fit to the stretched film is less satisfactory by the model. Hydrostatic extrusion in polymers is thus assumed to be an affine orientation process in the amorphous phase and the stretching process is non-affine. Author (GRA)

SYNTHESIS OF ARTICULATED ALL-PARA POLYMERS Final Report, Nov. 1977 - Dec. 1979
R. C. Evers, F. E. Arnold, and T. E. Helminiak Oct. 1981 35 p refs
(AF Proj. 2303)
(AD-A107554; AFWAL-TR-81-4098) Avail: NTIS HC A03/MF A01 CSCL 11/9

Articulated all-para-polymers with 2,6-benzobisoxazole, 2,6-benzobisthiazole, and 2,6-benzobisimidazole units in the backbone were synthesized by copolycondensation in polyphosphoric acid of 4,6-diamino-1,3-benzenediol dihydrochloride, 2,5-diamino-1,4-benzenedithiol dihydrochloride, and 1,2,4,5-tetraaminobenzene tetrahydrochloride, respectively, with terephthalic acid and reactive diphenoxybenzene monomers. Inherent viscosities of up to 12.57 dL/g (CH3SO3H, 25 C, 0.2g/d1) were achieved. The average length of the rod-like all-para segments between the relatively flexible diphenoxybenzene units was controlled by the stoichiometry of the copolycondensation reactions. Films which exhibited optical birefringence under crossed polars could be cast from methanesulfonic acid solutions of the polymers. Modulus and tensile strength values as high as 4696 mPa and 93 mPa, respectively, were recorded. Thermooxidative stability of the articulated polymers was evaluated by isothermal aging in air at 316 C. Stability for the articulated polybenzobisoxazoles was found to decrease with increased content of the diphenoxybenzene structure. The articulated polybenzobisoxazole structure was shown to be less stable than the anlogous polybenzobisthiazole structure but more stable than the articulated polybenzobisimidazole structure. GRA

PREPARATION OF MULTISHELL ICF TARGET PLASTIC-FOAM CUSHION MATERIALS BY THERMALLY INDUCED PHASE-INVERSION PROCESSES

A. T. Young, D. K. Moreno, and R. G. Marsters 1981 18 p refs Presented at the 28th Natl. Vacuum Symp., Anaheim, Calif., 3-6 Nov. 1981
(Contract W-7405-eng-36)
(DE82-000574; LA-UR-81-2722; CONF-811113-10) Avail: NTIS HC A02/MF A01

Homogenous, low-density plastic foams for laser fusion targets were prepared by thermally induced phase inversion processes. Uniform, open cell foams were obtained by the rapid freezing of water solutions of modified cellulose polymers with densities in the range of 5 mg/cu cm to 0.7 mg/cu cm and respective average cell sizes of 2 to 40 micrometers. In addition, low-density, microcellular foams were prepared from the hydrocarbon polymer poly(4-methyl-l-pentene) via a similar phase inversion process using homogenous solutions in organic solvents. These foams have densities from 2 to 5 mg/cu cm and average cell sizes of 20 micrometers. The physical-chemical aspects of the thermally induced phase inversion process are presented. DOE

METAL-CONTAINING PLASMA-POLYMERIZED COATINGS FOR LASER-FUSION TARGETS

S. A. Letts and C. W. Jordan 14 Sep. 1981 9 p refs Presented at the Am. Vacuum Soc. Natl. Symp., Anaheim, Calif., 2-6 Nov. 1981
(Contract W-7405-eng-48)
(DE82-000346; UCRL-86184; CONF-811113-9) Avail: NTIS HC A02/MF A01

Addition of metal to plastic layers in some direct drive laser fusion targets is needed to reduce electron induced fuel preheat. A plasma polymerization coating system was constructed to produce a metal seeded polymer by adding an organometallic gas to the usual trans-2-butene and hydrogen feedstocks. Since organometallic gases are highly reactive and toxic, safety is a major concern in the design of a coating system. The coating apparatus was designed with three levels of containment to assure protection of the operator. The gas handling system has redundant valves and was designed to fail safe. Several sensor controlled interlocks assure safe operating conditions. Waste materials are collected on a specially designed cold trap. Waste disposal is accomplished by heating the traps and purging volatile products through a reactor vessel. The design, operating procedure, and safety interlocks of this coating system are described. DOE

N82-16252# Sandia Labs., Albuquerque, N. Mex.

INTERFEROMETRIC STUDY OF EPOXY RESIN GELATION

K. R. Hirschbuehler 1981 28 p refs Presented at Office of Naval Res. Critical Rev.: Techniques for the Characterization of Composite Mater., Cambridge, Mass., 8 Jun. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030128; CONF-8106158-1) Avail: NTIS HC A03/MF A01

The transition of epoxy resins from a mobile liquid to a rubbery gel is a complex process depending on chemical reaction kinetics and both heat and mass transfer. The purpose of this study is to determine the locus of initial gelation in an epoxy resin, and the course of gelation through both neat resins and glass fiber/epoxy resin composites. This was accomplished by monitoring the local changes in refractive index in transparent epoxy castings using laser interferometry, supplemented by temperature profiles obtained from thermocouple arrays. These experiments were carried out on pure DGEBA epoxy (DOW DER-332) cured with a variety of primary amine, secondary amine, and anhydride curing agents. DOE

CRACK BRANCHING IN BRITTLE MATERIALS. PART 1: ANALYTICAL ASPECTS

H. P. Rossmanith 1980 148 p refs
(Grant NSF DAR-77-05171)
(PB81-243735; NSF/RA-800560) Avail: NTIS HC A07/MF A01 CSCL 11B

Fracture processes associated with crack acceleration and branching, conditions for branching, and the dependence of the branching angle on fracture test specimen geometry and loading conditions are discussed. Stress wave induced crack branching was investigated. A comparative study of explosively induced fracture and crack branching in glass, polymers, and rock is included. Some of the most frequently employed static and dynamic crack models are summarized and briefly discussed. Information on mathematical models for dynamic crack branching covers pre-branching analysis, elastic crack problem, elasto-plastic crack problem, secondary cracking ahead of the crack tip, the c-K-relationship, and the dynamic c-K-curve. GRA

SOME APPLICATIONS OF FOURIER TRANSFORM INFRARED SPECTROSCOPY IN THE EXAMINATION OF PAINTING MATERIALS

Richard Newman 1981 29 p refs
(Grant NEA-92-2033-386)
(PB81-249575) Avail: NTIS HC A03/MF A01 CSCL 11C

Although limited in its applications to painting materials, infrared spectroscopy nevertheless is very useful and even essential in helping to fully characterize certain of these materials. Fourier transform infrared spectroscopy offers several advantages over traditional dispersive infrared spectrophotometry, and generally gives spectra of higher quality than those obtainable with older instrumentation. Applications to resins and several traditional modern pigments are described, and the theoretical basis for spectral correlations in inorganic compounds containing polyatomic ions (which include many pigments) is briefly discussed. PROPELLANT SURVEILLANCE REPORT LGM-30 A, B, F AND G STAGE I TP-H1043 AFT CLOSURE PROPELLANT Semiannual Report

John A. Thompson Oct. 1981 70 p refs
(AD-A107877; MANPA-462(81)) Avail: NTIS HC A04/MF A01 CSCL 21/9

This report contains propellant test results from cartons of TP-H1043 propellant representing selected batches used in the aft closure of First Stage Minuteman Motors. Data from TP-H1043 propellant obtained from the aft closures of the LGM-30 A, B, F, and G Motors are reported in regression analyses for the sixth time and the fifth time using the G085 Computer System. In previous reports, A, B, F, and G data were combined for statistical analysis. For this report, a separate statistical analysis was made for A and B (wing 2) and F and G (wing 6). The statistical analysis includes regressions and covariance analysis. Testing was accomplished in accordance with MMWRBA Project M8293C. An analysis of all parameters indicate that no significant degradation is anticipated for at least two years past the oldest data point. Each point on the regression plot represents all samples at that particular age. The number of samples of each point is indicated on the sample size summary sheet on the page accompanying each regression plot. The data range at any age can be found by suitable inquiry of the G085 System. Author (GRA)

SKID-TEST EVALUATION OF PROTECTIVE COVERINGS FOR EXPLOSIVE BILLETS

Jim A. Crutchmer Sep. 1981 8 p ref
(Contract DE-AC04-76DP-00487)
(DE82-000072; MHSMP-81-39; Process-Develop-Endeavor-301) Avail: NTIS HC A02/MF A01

A total of thirteen materials were evaluated for use as protective coverings for as-pressed explosive billets. A small sample of material was taped over the contact area of the skid billets during testing. Preliminary skid testing indicated several of these materials may be effective as protective coverings. Three of the materials were selected, based on their strength and ease of handling, for complete skid test evaluation using as-pressed PBX 9404. Nylon mesh, style 8664 was found to give the greatest protection against accidental detonation of the explosive. DOE

ENVIRONMENTAL ASSESSMENT OF THE USE OF ALCOHOL FUELS IN HIGHWAY VEHICLES

O. M. Bevilacqua, M. J. Bernard, III, D. Sperling, S. Rosenberg, L. J. Hill, D. Fingleton (WAPORA, Inc., Chicago), P. DEliscu (Santa Clara Univ.), and J. R. Gasper Dec. 1980 307 p refs
Prepared jointly with Argonne National Lab.
(Contract W-7405-eng-38)
(DE82-000887; ANL/CNSV-14) Avail: NTIS HC A14/MF A01

Impact associated with alcohol fuel storage, distribution, and use are assessed under four possible scenarios of alcohol fuel use during the period 1980 to 2000. Alcohol use is projected to range from 196 million bbl/yr by 2000, up from 5 million barrels in 1980. In addition to effects on the physical environment (aquatic and terrestrial ecosystems, air quality, and energy resources), consideration is given to the impacts of alcohol fuel use on such social and economic concerns as health and safety, employment, retail fuel costs, balance of trade, capital investments, and regulatory needs. Although some potentially negative impacts are identified, in general, the assessment finds that the use of alcohol fuels would have a positive or neutral effect on the environment; moreover, the negative impacts could be mitigated through the judicious application of existing regulatory controls and procedural standards. POTENTIAL ECONOMIC BENEFITS FROM PROCESS CONTROL OF COAL PREPARATION PLANTS

N. C. Bradley, G. O. Allgood, and J. C. Moyers Oct. 1981 55 p refs
(Contract W-7405-eng-26)
(DE82-000881; ORNL-5736) Avail: NTIS HC A04/MF A01

In practically all US coal preparation plants, the machines and instrumentation and control devices are manually operated to clean the run-of-the-mine coal of mud, rock, and other contaminants that are removed from the earth with the desired product. The result is a large loss of a valuable natural resource. Based on 1978 production figures, 10 million tons of discarded coal could have been saved by on-line measurement and control techniques. Measurement sensors for on-line control of coal cleaning process should be developed because there are no commercial, moderate-cost sensors of medium accuracy (5 to 10 percent) available for such applications. An expenditure of approximately $10 million to develop measurement sensors and process control techniques for coal preparation would be recovered by the conservation of coal. DOE

SUNFLOWER SEED OIL AS AN EXTENDER FOR DIESEL FUEL IN AGRICULTURAL TRACTORS

J. J. Bruwer, B. vanD. Boshoff, F. J. C. Hugo, L. M. duPlessis, J. Fuls, C. Hawkins, A. N. vanderWalt, and A. Engelbrecht 1980 8 p refs Presented at the Symp. of the South African Inst. of Agr. Engr., Silverton, South Africa, 11 Jun. 1980
(DE81-903440; CONF-8006187-1) Avail: NTIS US Sales Only HC A02/MF A01; DOE Depository Libraries

The use of sunflower seeds as an extender for diesel fuels in agricultural tractors is considered. Production requirements to meet the demand are briefly reviewed. Physical and chemical properties of sunflower seed oil are discussed. Tractor engines using diesel fuel or sunflower seed oil were tested as well as engines using various blends of sunflower seed oil with gasoline, diesel fuel, power kerosene, and illuminating kerosene. Results were compared. Engine service life and injection equipment performance are discussed. DOE

ASSESSMENT OF THE ECONOMIC, TECHNICAL, AND ENVIRONMENTAL FEASIBILITY OF DEVELOPING, CONSTRUCTING, AND OPERATING A 25-MILLION-GALLON-PER-YEAR GRAIN-ETHANOL-PRODUCTION FACILITY. VOLUME 1: EXECUTIVE SUMMARY

May 1981 47 p 4 Vol.
(Contract DE-FG07-80RA-50365)
(DE82-000294; DOE/RA-50365/T1-Vol-1) Avail: NTIS HC A03/MF A01

The economic, technical, and environmental feasibility of developing, constructing, and operating a 25 million gallon per year ethanol facility in northeastern Oklahoma was determined. The executive summary is presented. A site providing the necessary grain, energy, and labor resources; flexible transportation methods and alternatives for receiving and shipping; nearby markets for products and by-products; an existing environmental quality able to withstand the minor impacts of the process; and a receptive and growing business and community environment was selected. The ability to produce a high quality product at a reasonable and competitive price with or without federal assistance or state assistance in the form of tax exemptions is demonstrated. It is shown that coal burning technologies are efficient, whether conventional burning methods or innovative methods such as fluidized-bed combustion are used. All resources for the process are available nearby. The grains required come from carryover reserves, thus not impacting the food supply. The residual by-products are in high demand. DOE

Preliminary theoretical and experimental analyses of fracture propagation in a nonuniform stress field were performed. Preliminary analyses of fluid flow in apertures were completed. The mechanical properties of some of the core material from Mesaverde sandstones and shales from wells in Wyoming and Colorado were characterized. The feasibility of ultrasonic techniques in measuring in-situ stresses was investigated. Development of a transducer package to test the measurements in a borehole, and techniques to evaluate and interpret measurements are described. The effect of stress on velocity anisotropy was investigated. Geologic studies relating in-situ stresses to geologic structure and examining the effects of pore pressure increases on fracturing in the Green River Basin due to gas generation were performed. DOE

(DE82-000223; DOE/ET-14705/22) Avail: NTIS HC A07/MF A01

At present, the major development effort is concentrated on gasification. As is typical for developmental projects of this magnitude, a large number of operating difficulties have been experienced and overcome since the first operations in August of 1976. Currently the overcoming of operating difficulties still requires some effort. However, most tests are stable and allow the gathering of process design data in the form of validated heat and material balances. These are applied in model simulations of gasifier operation. DOE

REVERSIBILITY OF COAL LIQUEFACTION
M. G. Thomas, T. C. Bickel, and D. E. Trudell 1981 16 p refs Presented at the Ann. Meeting of the Inst. of Chem. Engr., New Orleans, 8 Nov. 1981
(Contract DE-AC04-76DP-00789)
(DE81-027804; SAND-81-0211C; CONF-811108-3) Avail: NTIS HC A02/MF A01

Dissolution of coal was shown to be affected by the amount of preasphaltenes formed which is related to the repolymerization of preasphaltenes when solvent quantity and/or quality are limited. Repolymerized preasphaltenes are shown to be reactive suggesting that a process reversibility exists for this first step of the liquefaction sequence and explaining limited solvation for early

stage liquefaction. This reversibility is direct evidence that gas formation is a non-essential side reaction that is a consequence of time at temperature, not the interconversion of coal derived materials. Addition of asphaltenes, increases the amount of oil produced. This increase is accompanied by some polymerization of the asphaltenes. Process reversibility is thus observed for both the primary and secondary step of liquefaction. The effect of increases in hydrogen availability by chemical spikes and/or H-donor molecules was shown to partially compensate for the solvent deficiencies observed in the later stages of processing.

SMALL-SCALE FUEL-ALCOHOL PLANT. VOLUME 2: DETAILED EQUIPMENT INFORMATION Design Report

Aug. 1981 206 p
(Contract DE-AC07-76ID-01570)
(DE82-001037; DOE/TIC-2001037-Vol-2; ID-10102-Vol-2)
Avail: NTIS HC A10/MF A01

Technical information about the equipment used in the Small Scale Fuel Alcohol Plant (SSFAP) is reported. Details are provided in the form of data sheets for off-the-shelf mechanical equipment and instrumentation. A specification is also included for a microprocessor. Complete drawings are included for mechanical hardware specifically designed for this plant. The information is arranged with all instrument and equipment data sheets grouped by the type of equipment. Vendor listings are provided for each type of equipment required. The design in this report represents the design after startup testing and some short periods of operation but before continuous production began. It is expected that a person or firm desiring to build a similar plant would hire a consultant or architect-engineering firm to modify this design to fit the specific application and site. DOE

SMALL-SCALE-FUEL-ALCOHOL PLANT. VOLUME 3: CONSTRUCTION INFORMATION Design Report

Aug. 1981 140 p
(Contract DE-AC07-76ID-01570)
(DE82-001036; DOE/TIC-2001036-Vol-3; ID-10102-Vol-3)
Avail: NTIS HC A07/MF A01

General information about the construction of the Small-Scale Fuel Alcohol Plant (SSFAP) is reported. Suggested design changes are listed: it is recommended that anyone planning to build a plant similar to this one consider incorporating these changes. The construction information included here consists of photographs of the plant, a list of important mechanical construction details, electrical drawings showing the power distribution schematic, and end-to-end wiring schematics for the plant control. The photographs show the relative locations of major equipment and can be used in conjunction with the Piping and Instrumentation Diagrams (P and IDs) in Appendix F of Volume 1 to physically lay out the plant. The design in this volume represents the design after startup testing and some short periods of operation but before continuous production began. It is expected that a person or firm desiring to build a similar plant would hire a consultant or architect-engineering firm. DOE

CONTROL OF FRACTIONATION-AREA CORROSION AT SRC PILOT PLANTS

J. R. Keiser, R. R. Judkins, V. B. Baylor, D. R. Canfield, and W. P. Barnett Oct. 1981 33 p refs
(Contract W-7405-eng-26)
(DE82-001949; ORNL/TM-7937) Avail: NTIS HC A03/MF A01

Fractionating columns at the Fort Lewis, Washington, and Wilsonville, Alabama, solvent refined coal pilot plants have experienced severe corrosion. This corrosion is most serious for materials exposed in the 230 to 2500 C range. Corrosion rates as high as 25 mm/year (1000 mils/year) on carbon steel and 6.4 mm/year (250 mils/year) on type 18-8 stainless steels have been observed. This corrosion problem was studied through exposure of coupons in the columns, analysis of failed through components from pilot plants, chemical analysis of liquids from the pilot plants, and operation of laboratory experiments. The in plant exposure of coupons shows that certain nickel base alloys have adequate corrosion resistance for the environment. Chemical analyses of pilot plant liquids show that the presence of appreciable levels of water soluble chloride is a necessary but not sufficient condition for these oils to be corrosive. DOE

FOREIGN COAL-LIQUEFACTION-TECHNOLOGY SURVEY AND ASSESSMENT

T. D. Pay and S. S. Patel Oct. 1981 341 p refs Prepared for ORNL
(Contract W-7405-eng-26)
(DE82-0009555; ORNL/Sub-79/13837/6) Avail NTIS HC A15/MF A01

The Foreign Coal Liquefaction Technology survey and Assessment is part of the International Energy Technology Assessment effort. Six countries were chosen. They are Australia, the Federal Republic of Germany (FRG), Japan, New Zealand, South Africa and the United Kingdom. These countries have active coal liquefaction programs, are using or developing technologies that could be used in the US and/or involved with US coal liquefaction programs. The resources that each has and the policies that have been adopted by their governments are presented. Although each of these countries has numerous programs underway or planned, the amount of information available on each program varies. Brief descriptions of the programs are given in the first chapter; the second chapter deals only with those liquefaction projects and gasifiers associated with direct liquefaction for which an adequate amount of reference material could be found. In the third chapter, critical areas common to all or many liquefaction systems are described. DOE

CONCEPTS OF FUNDAMENTAL PROCESSES RELATED TO GASIFICATION OF COAL Quarterly Progress Report, Jan. - Mar. 1981

W. H. Wiser Sep. 1981 3 p
(Contract DE-AM03-77SF-01484)
(DE82-000763; DOE/SF-01484/T2) Avail: NTIS HC A02/MF A01

The primary objective of the research on single stage catalytic coal gasification is to optimize the process variables and catalyst systems to maximize yields. The 200 mesh coal will be slurried in a hydrogen donor solvent, tetralin, in a ratio of 2 parts solvent to 1 part coal by weight, and initially a sulfided Ni-W/SiO2-Al2O3 catalyst will be used. All of the required equipment arrived and the system has undergone pressure testing and some minor redesign. The objective of the project on single stage coal gasification to high Btu gas is to investigate the potential for obtaining high methane yields by direct catalytic hydrogenation of coal in a single stage with a maximum temperature of 5500 C. The work completed so far has included a thermodynamic feasibility study which involved investigating the effect of various parameters, temperature, pressure, and steam percent in hydrogen feed. Fifteen experimental runs have been completed. DOE

EXPERIMENTAL STUDY OF THE MULTIPLE STEADY STATES IN AN ADIABATIC COAL-LIQUEFACTION REACTOR Annual Report, 1 Sep. 1980 - 31 Aug. 1981

Y. T. Shah and P. C. Singh Sep. 1981 75 p refs
(Contract DE-FG22-80PC-30243)
(DE82-000770; DOE/PC-30243/T2) Avail: NTIS HC A04/MF A01

The purpose of the proposed study is to investigate experimentally the thermal behavior of coal liquefaction reactors. Stability of the steady state is specifically planned to be investigated in the adiabatic continuous stirred tank reactor used in the A-1 unit of the Gulf Research Center. When a reactor has more than one possible temperature for steady state operation, large temperature excursions may result from a small perturbation. An efficient control of temperature is then needed to avoid this type of run away of the reactor. In case of coal liquefaction reactors, below 4500 C no substantial reaction is observed, while above 4650 C there is every possibility of coking of the reactor.

The operating range is thus very narrow and it is undesirable to have temperature excursions. A theoretical investigation of these reactors has shown multiple steady states in pilot plant operations. Industrial coal liquefaction reactors operate very close to an adiabatic mode. DOE

INVESTIGATION OF SULFUR-TOLERANT CATALYSTS FOR SELECTIVE SYNTHESIS OF HYDROCARBON LIQUIDS FROM COAL-DERIVED GASES **Quarterly Technical Progress Report, 19 Mar. - 18 Jun. 1981**
C. H. Bartholomew 15 Jul. 1981 32 p refs
(Contract DE-AC01-79ET-14809)
(DE82-000274; DOE/ET-14809/7-7) Avail: NTIS HC A03/MF A01

During the seventh quarter, preparation of the proposed boride-promoted catalysts was completed. An aqueous solution technique was found to improve the preparation of the supported metal boride catalysts. Characterization of 3 and 15% cobalt catalysts by O2 titration ahd H2 and CO chemisorptions showed dispersions to be near 7.3%. Reduction was optimum after 36 hours at 623 K. Activity/selectivity measurements showed Co/SiO2 catalysts to be more active by an order of magnitude than corresponding Fe/SiO2 catalysts in Fischer-Tropsch synthesis. The unsupported cobalt boride was found to be less active, though it produced a higher molecular weight product than similar silica--support cobalt catalysts. H2S deactivation equipment construction and calibration has been completed and preliminary tests performed. DOE

DYNAMIC BEHAVIOR OF MOVING-BED COAL-GASIFICATION REACTORS **Annual Report, 1 Sep. 1980 - 31 Aug. 1981**
B. Joseph Sep. 1981 82 p refs
(Contract DE-FG22-80PC-30219)
(DE82-000595; DOE/PC-30219/T1) Avail: NTIS HC A05/MF A01

A rigorous dynamic model of the two moving-bed coal gasifier was developed. The resulting coupled nonlinear partial differential equations were solved numerically using a digital computer. The model was validated through comparison with steady state pilot plant operating data and with results of existing steady state models. A number of transient studies were conducted using the dynamic mode including response to variations in coal feed rate, steam rate and oxygen feed rate. The internal solid and gas temperature profiles as well as the product gas composition were tracked as a function of time. The stability of the gasifier under various types of feedback control strategies were studied. The results are given in the form of response curves to typical input disturbances. DOE

CLOSED-SYSTEM FREEZING OF SOILS IN LININGS AND EARTH EMBANKMENT DAMS
Chester W. Jones Mar. 1981 56 p refs
(PB81-240491; REC-ERC-81-1) Avail: NTIS HC A04/MF A01 CSCL 13B

A brief review of studies of closed-system freezing (no source of water except that in voids) of compacted soil canal linings, laboratory and field test results show that under certain soil and temperature conditions, freezing decreases soil density near the surface, but increases density at depth. In two linings, the average density increased slightly during a 20-year period. Frost penetration measurements made during the 1978-79 winter on a 1,5-thick reservoir lining, on three earth dams under construction, and on the Teton Dam remnant are shown along with associated soil conditions, air freezing indexes, and insulating effects of snow and, for one dam, a loose soil cover. EVALUATION OF FLEXIBLE PAVEMENT CRACK SEALING METHODS USED IN UTAH **Final Report**
Michael C. Belangie and Douglas I. Anderson Jan. 1981 121 p refs Sponsored by Federal Highway Administration
(PB81-239469; UDOT-MR-81-1; FHWA/UT-81/1) Avail: NTIS HC A06/MF A01 CSCL 13B

Criteria to improve the effectiveness of Utah's flexible pavements crack sealing practice were studied. Field measurements, in-depth interviews questionaires were used. Findings indicate that flexible pavement cracking is a significant problem in the Far West, Rocky Mountains, Great Lakes and New England. Choice of materials is effected by storage requirements and equipment available. Prepackaging of materials designed for crack sealing has resulted in improvements in control of mix and material properties. Low temperature and freeze thaw cycles significantly effect the amount of thermal cracking and the performance of crack sealant. Ductile sealants, such as Crumb rubber/asphalt cement mixes, in combination with routing appear to offer substantial gains in sealant life and performance. M.D.K.

EARTHQUAKE ENGINEERING OF LARGE UNDERGROUND STRUCTURES Final Report, Apr. 1978 - Sep. 1980

G. Norman Owen and Roger E. Scholl Jan. 1981 299 p refs
Sponsored in part by Federal Highway Administration
(Grant NSF PFR-77-06505)
(PB81-247918; JAB-7821; FHWA/RD-80/195) Avail: NTIS HC A13/MF A01 CSCL 13B

The current state of the art of earthquake engineering of transportation tunnels and other large underground structures is evaluated. A review of the past performance of 127 underground openings during earthquakes indicates that underground structures in general are less severely affected than surface structures at the same geographic location. However, some severe damage, including collapse, has been reported. Stability of tunnels during seismic motion is affected by peak ground motion parameters, earthquake duration, type of support, ground conditions, and in situ stresses. The literature on the nature of underground seismic motion is reviewed in detail. Although recorded underground motions tend to substantiate the idea that motion does reduce with depth, amplification at depth has been observed. GRA

EXPERIMENTAL PAVEMENT DELINEATION TREATMENTS Interim Report

James E. Bryden and Ronald A. Lorini Jun. 1981 42 p refs
(PB81-249161; RR-81-87; FHWA/NY/RR-81/87; IR-2) Avail: NTIS HC A03/MF A01 CSCL 13B

Visibility and durability of materials used to delineate shoulders and medians adjacent to asphalt pavements were evaluated. Materials evaluated were polysulfide and coal tar epoxies, one and two component polyesters, portland cement, acrylic paints, modified-alkyd traffic paint, preformed plastic tape, and thermoplastic markings. Neat applications, sand mortars, and surface treatments were installed in several geometric patterns including cross hatches, solid median treatments, and various widths of edge lines. Thermoplastic pavement markings generally performed very well, providing good visibility under adverse viewing conditions for at least 4 years. Thermoplastic 4 in. wide edge lines appear to provide adequate visibility for most conditions. Author

LABORATORY PAVEMENT POLISHING DEVICE (WEAR MACHINE) VERSUS FIELD FRICTION TEST UNITS AND ACCUMULATIVE TRAFFIC (ADT). PHASE 2. CORRELATION STUDY Final Report

H. F. Godwin, D. B. Loyed, W. G. Miley, and G. C. Page Apr. 1981 63 p refs
(PB81-233256; FL/DOT/OMR-81/240; FHWA/FL-81/240) Avail: NTIS HC A04/MF A01 CSCL 13B

The degree to which pavement wear (vehicular traffic) could be predicted from testing samples of in-service pavements in the laboratory pavement polishing device was determined. This investigation was made on asphaltic concrete pavements, primarily friction courses used in Florida. These pavements were tested at different levels of accumulative traffic (ADT) for approximately 2 years. T.M.

A PRELIMINARY EVALUATION OF THE SYSTEM FOR INVENTORYING ROAD SURFACE TOPOGRAPHY (SIRST) Evaluation Report, Jun. 1979 - May 1980

J. C. Wambold and L. C. Meczkowski Jul. 1981 45 p
(PB81-249336; FHWA/RC-81/089) Avail: NTIS HC A03/MF A01 CSCL 13B

A brief overview of a System for Inventorying Road Surface Topography (SIRST) is described. A description of the operating principle is given as well as a description of the individual components. A preliminary evaluation of the system and its components is included, together with a discussion of the operating experience. It is concluded that the present system is usable; however, a more complete evaluation and further development are needed to adapt the system for highway department use. Several modifications are recommended for over the road environment and ease of calibration. GRA

EVALUATION OF THE FEASIBILITY OF ESTABLISHING A NATIONAL TESTING CAPABILITY FOR THE SIMULATION OF EARTHQUAKE LOADS ON LARGE-SCALE STRUCTURES

Cornelius J. Higgins and D. W. Steedman Mar. 1981 57 p refs
(Grant NSF PFR-80-09884)
(PB81-243875; NSF/CEE-81018) Avail: NTIS HC A04/MF A01 CSCL 13M

Literature investigations and communications with engineers and scientists active in the field of earthquake engineering were conducted. The need for large-scale testing, high priority projects, test facility requirements, management concepts, and funding requirements were evaluated. There was a consensus that there is strong justification for a national large-scale testing program. Testing is needed to allow thorough investigation of the nonlinearities and inelasticities in the behavior of realistic structures as they approach their ultimate capacity. The definition of large-scale, the place of large-scale testing in the overall scheme of earthquake engineering research, the planning and cost estimating for the development of test support requirements, and a management concept integrating the capabilities and interests of university, industry, consulting, and government engineers and scientists were topics addressed. BUILDING TECHNOLOGY PROJECT SUMMARIES, 1980 - 1981

Noel Raufaste and Michael Olmert Jul. 1981 89 p
(PB82-106105; NBS-SP-446-5) Avail: NTIS HC A05/MF A01 CSCL 13M

The mission of the Center for Building Technology (CBT) is to increase the usefulness, safety, and economy of buildings through the advancement of building technology and its application to the improvement of building practice. CBT's research activities support the building technology programs of Federal, State, and local governments; assist the design professions, building officials, and the research community by developing improved design criteria; and assist manufacturers of building products by developing methods for evaluating innovative materials, components, and systems. CBT provides an objective source of technical information for national consensus standards and model code organizations. Close cooperation with these groups leads to standard practices that meet the needs of the regulatory authorities of State and local governments. Research providing the knowledge for these standard practices is conducted in cooperation with Government, university, and industry laboratories. This report summarizes CBT's research for 1980-1981. DESIGN FOR MANUFACTURABILITY: DESIGN FOR FORGING, PART 2 M.S. Thesis

A. Rigioni and G. Boothroyd Apr. 1981 122 p refs
(Grant NSF APR-77-10197)
(PB82-101692; NSF/MEA-81009-Pt-2; Rept-13) Avail: NTIS HC A06/MF A01 CSCL 13H

Practical design recommendations for conventional forgings are presented. Recommendations are considered for the design of individual features such as ribs, depressions, and holes. Forging tolerances and allowances, as well as forging drafting practices, are explained. Included are some guidelines for evaluating parting line location. Forging design data sheets are described, including a brief explanation of how they were obtained. The use of the handbook is illustrated by means of a practical example, outlining all of the necessary steps in the design of a forged product. The appendix contains a list of forging terms and their definitions. GRA

DEVELOPMENT OF STRENGTH IN CEMENTS Interim Report, Sep. 1977 - Sep. 1978
B. Matkovic Washington Federal Highway Administration Apr. 1981 149 p refs Sponsored in part by DOT and Yugoslav Joint Board on Scientific and Technological Coopecation
(PB82-103979; FHWA/RD-80/128) Avail: NTIS HC A07/MF A01 CSCL 13C

The production of doped belite (dicalcium silicate) clinkers as a prospective means for saving energy in Portland cement production is described. This is accomplished by small additions of either barium sulfate (BaSO4), calcium tribasic phosphate (Ca5(PO4)3OH), or vanadium oxide (V2O5) to belite (Ca2SiO4) clinker. In addition to conserving energy, doping the belite with barium sulfate imparts greater strength to the resulting modified belite. Reactants, additives, and factors contributing to the fabrication of Sorel cement are described. Author (GRA)

INVESTIGATION OF THE USE OF COAL REFUSE-FLY ASH COMPOSITIONS AS HIGHWAY BASE COURSE MATERIAL Final Report, Oct. 1977 - Sep. 1980
Paul V. McQuade, W. J. Head, and Robert B. Anderson Jun. 1981 68 p Prepared in cooperation with West Virginia Univ., Morgantown
(Contract DOT-FH-11-9324)
(PB82-101940; FHWA/RD-80/129; Rept-77-522) Avail: NTIS HC A04/MF A01 CSCL 13C

The utilization of coal refuse-fly ash compositions as highway base course material is surveyed. The results of a laboratory testing program into the physical and engineering properties of mixtures of these waste products are presented. A comparison of serviceability index and physical damage parameters based on the VESYS Predictive Design Procedure between crushed stone and coal refuse-fly ash compositions are presented. These findings indicate that substituting stabilized coal refuse-fly ash blends in place of conventional base course material is technically and economically feasible. Procedures for developing design mixes and conducting field tests of coal refuse-fly ash base course material are described. Author

EVALUATION OF SUPER-WATER REDUCERS FOR HIGHWAY APPLICATIONS Final Report
D. Whiting Washington Federal Highway Administration Mar. 1981 184 p refs
(Contract DOT-FH-11-9258)
(PB82-101106; FHWA/RD-80/132) Avail: NTIS HC A09/MF A01 CSCL 13C

Super-water reducers were characterized and evaluated as potential candidates for production of low water to cement ratio, high strength concretes for highway construction applications. Admixtures were composed of either naphthalene or melamine sulfonated formaldehyde condensates. A mini-slump procedure was used to assess dosage requirements and behavior of workability with time of cement pastes. Required dosage was found to be a function of tricalcium aluminate content, alkali content, and fineness of the cement. Concretes exhibited high rates of slump loss when super-water reducers were used. The most promising area of application of these products appears to be in production of dense, high cement content concrete using mobile concrete mixer/transporters. Author (GRA)

MECHANISTIC INTERPRETATION OF NONDESTRUCTIVE PAVEMENT TESTING DEFLECTIONS Interim Report
M. S. Hoffman and M. R. Thompson Jun. 1981 262 p refs Sponsored in part by Illinois State Dept. of Transportation
(PB82-107095; TRANSPORTATION-ENGR-SER-32; UILU-ENG-81-2010; FHWA/IL/UI-190) Avail: NTIS HC A12/MF A01 CSCL 13B

A method for the back calculation of material properties in flexible pavements based on the interpretation of surface deflection measurements is proposed. The ILLI-PAVE, a stress-dependent finite element pavement model, was used to generate data for developing algorithms and nomographs for deflection basin interpretation. Twenty four different flexible pavement sections throughout the State of Illinois were studied. Deflections were measured and loading mode effects on pavement response were investigated. The factors controlling the pavement response to different loading modes are identified and explained. Correlations between different devices are developed. The back calculated parameters derived from the proposed evaluation procedure can be used as inputs for asphalt concrete overlay design. Author (GRA)

EXPLORATORY STUDY OF CONSTRAINTS ON DESIGN BY FUNCTIONAL REQUIREMENTS AND MANUFACTURING Annual Report, 1979 - 1980
Nam P. Suh, Adam C. Bell, David R. Wilson, and James R. Rinderle Jan. 1981 146 p refs
(Grant NSF DAR-77-13296)
(PB82-101858; LMP/AXM-81-02; NSF/MEA-81008) Avail: NTIS HC A07/MF A01 CSCL 13H

Some of the concepts and terminology of the axiomatic approach to design and manufacturing are presented. The manner in which this approach fits into the overall design process is illustrated. Two axioms are derived: maintain the independence of functional requirements; and minimize the information content. Coupling in a design as it relates to the first axiom is discussed. Some quantitative measures of coupling are presented with examples to illustrate the concepts of coupled and uncoupled designs. The issue of complexity in design and manufacturing is considered, including the relativity and consequences of a particular measure of complexity. Author

WATER REPELLENT SOILS: A STATE-OF-THE-ART Final General Technical Report
Leonard F. DeBano Mar. 1981 27 p refs
(PB81-248270; FSGTR-PSW-46) Avail: NTIS HC A03/MF A01 CSCL 08M

Most problems of water repellancy in soils arise because of poor infiltration, difficulties in establishing plants, increased runoff and erosion, and plant diseases. An especially acute problem in southern California is the relationship between these soils and the high rates of runoff and erosion of freshly burned watersheds. Water repellent substances are beneficial in harvesting water and reducing evaporation losses. These same substances provide a practical method of improving soil structure and aggregate stability. Much is known about the physics of water movement through these soils and the role of fire in their formation. GRA

TECHNOLOGY FOR IMPROVING THE WEAR RESISTANCE OF AGGREGATES BY MATERIALS IMPREGNATION Final Report, May 1977 - Dec. 1980
Ronald P. Webster and Jack J. Fontana Aug. 1981 80 p refs
(Contract DOT-FH-7-3-0070)
(PB81-246191; FHWA/RD-81/115) Avail: NTIS HC A05/MF A01 CSCL 13C

Tests performed to evaluate the effect of impregnation on the physical, mechanical, wear resistance and polish resistance properties of the aggregates included: petrographic analysis, Los Angeles abrasion loss, sodium sulfate soundness loss, the British polish wheel, aggregate surface microtexture analysis, and two circular test track studies. Impregnants studied included: MMA based and styrene based monomer systems, water based phenol formaldehyde resin, and sodium silicate. In general, it was found that the physical and mechanical properties of natural aggregates can be significantly improved by impregnation. Significant improvements in wear resistance can also be obtained, however, in some instances, this improvement is accompanied by a decrease in polish resistance. T.M.

THIN, APPLIED SURFACING FOR IMPROVING SKID RESISTANCE OF CONCRETE PAVEMENTS Final Report
Charles F. Scholer 3 Dec. 1980 29 p Sponsored in part by Indiana State Highway Commission
(PB81-247744; JHRP-80-16; FHWA/IN/JHRP-80/16) Avail: NTIS HC A03/MF A01 CSCL 13B

The use of select aggregate in a thin wearing surface of portland cement mortar to prolone or restore a concrete pavement's ability to develop high friction was accomplished. Two fine aggregates, blast furnace slag and lightweight expanded shale were found to exhibit skid resistance greater than the other aggregates evaluated. The British polishing wheel was used in the laboratory evaluation of aggregate to simulate wear. The need for a method of restoring friction to a worn, but otherwise sound concrete pavement led to a field evaluation of several different techniques for placing a very thin overlay. The successful method was a broomed, very thin layer of mortar, 3 mm thick. GRA

THE OPTIMAL PLANNING OF COMPUTERIZED MANUFACTURING SYSTEMS
William C. Lewis, Jr., Moshe M. Barash, and J. J. Solberg Dec. 1980 207 p refs
(Grant NSF APR-74-15256)
(PB81-241564; NSF/RA-800556; REPT-18) Avail: NTIS HC A10/MF A01 CSCL 13H

A new class of control algorithms for computer operated manufacturing systems (CMS) was defined and tested. The definition is sufficient to permit construction of any element of the new class by a practitioner with backgrounds in electronic devices, NC machine tools, computer operating systems, and data flow. Reliability, repairability, and extensibility were considered. The test applied the new class to control two simulated systems-one similar to existing systems, the other using adaptive machine tools. For each system, the new class functioned successfully. Non-failing machine tool utilization exceeded 95 percent for failure rates from 3-16 percent per machine tool. The batch weights had a strong effect on relative flow time. GRA

THE OPTIMAL PLANNING COMPUTERIZED MANUFACTURING SYSTEMS
M. F. Neuts, D. M. Lucanton, and C. Geiszler Feb. 1981 35 p refs
(Grant NSF APR-74-15256)
(PB81-245284; NSF/MEA-81006; Rept-19) Avail: NTIS HC A03/MF A01 CSCL 13H

The utility of interactive computation in answering questions on the behavior, design, and control of certain service systems is demonstrated. The stationary distributions of various waiting times are also discussed. A queue with N servers which may break down and require repair at a facility which has C repair crews is studied. Under exponential assumptions, this model has an algorithmically tractable solution. It is then a particular case of the M/M/n queue in a Markovian environment. It is shown that during periods when most servers are down, large build-ups may occur which affect the queue adversely for a long time afterwards. Potential applications are in manpower planning, as in a typing pool where persons may be absent, and in determining the size of a battery of machines, where machines may be inoperative due to maintenance and repair. GRA

ADAPTIVE PROCESSING FOR LOW RCS TARGETS Final Technical Report, Apr. 1979 - Feb. 1980
Lee A. Morgan and Steven Weisbrod Griffiss AFB, N.Y. RADC Aug. 1981 50 p refs
(Contract F30602-79-C-0142; AF Proj. 4506)
(AD-A106685; R8-80) Avail: NTIS HC A03/MF A01 CSCL 17/9

An adaptive system to determine and transmit a radar signal matched to a target's impulse response was designed, breadboarded and tested. The application is to targets which consist of discrete point-like scatterers. A pilot signal consisting of a single short pulse is transmitted. The return from this pilot pulse is range gated in a network which generates a piecewise approximation of the conjugate of the impulse response. This approximation becomes the matched signal which is then transmitted. The system was demonstrated to provide nearly theoretical target enhancement even when the pilot pulse return was at the receiver noise level. Operation under situations where the target-impulse response was changing was also demonstrated. Problem areas in the implementation are described. Author (GRA)

HIGH ALTITUDE ATMOSPHERIC INVESTIGATIONS. PART 2: DEVELOPMENT OF IN-SITU EXPERIMENTS FOR MEASUREMENTS IN THE D-REGION OF THE IONOSPHERE AND THEIR RESULTS Final Report, 1 Aug. 1975 - 1 Aug. 1980
Hans-Ulrich Widdel 3 Jun. 1981 118 p refs
(Grant DA-ERO-75-G-076; DA Proj. 1T1-61102-BH-57)
(AD-A106770) Avail: NTIS HC A06/MF A01 CSCL 20/14

Results of A3 absorption, radio absorption measured from the ground is determined by the integral over the electron density weighted with the collision frequency of the electrons with the ambient neutral gas. The boundaries of the relevant conditions are difficult to establish. Absorption is also affected by properties of the ionosphere, and these properties change with seasons, Sun position, and other factors. These multiple effectors make unambiguous interpretation impossible. The report describes attempts to select and describe parameters that might most strongly influence radio wave absorption. Technical details of in-situ experiments to measure wind and electron density are communicated and some results obtained with these instruments are presented. It was found that the ratio between the positive ion current and the electron current measured with the guarding, probe experiment is affected by both, the ion composition in the ion sheath and by neutral air temperature. This might explain the ambiguities found when a direct comparison of results obtained with 'Langmuir' probes and wave propagation experiments is attempted. The effect might be used to derive local air temperatures provided that the ion composition of the ion sheath is known and that a quantitative theoretical description can be established. HC A02/MF A01 CSCL 17/2

The diurnal and random motion of the ionosphere cause both translation and spreading of the frequency spectrum of signals transmitted through it. A predictive model was built and compared to experimental data and found to successfully predict frequency shifts and spreads induced by ionospheric inhomogeneities. Another model was developed to describe the reflection of HF pulses by a randomly inhomogeneous, dispersive and absorptive ionosphere. It is seen that delay distortion, diffuse multipath and frequency incoherence effects are small compared to the discrete multipath spread resulting from large scale variations of the ionospheric electron number density. In laboratory experiments the electron number density profile of a low pressure RF-generated Argon plasma was measured concurrently using microwave and optical diagnostic techniques. In a peripheral study, interesting results in antenna performance for efficient pulse radiation were found. Author (GRA)

HC A05/MF A01 CSCL 09/5

The fundamental efficiency of adaptive algorithms is analyzed. It is found that noise in the adaptive weights increases with convergence speed. This causes loss in mean-square-error performance. Efficiency is considered from the point of view of misadjustment versus speed of convergence. A new version of the LMS algorithm based on Newton's method is analyzed and shown to make maximally efficient use of real-time input data. The performance of this algorithm is not affected by eigenvalue disparity. Practical algorithms can be devised that closely approximate Newton's method. In certain cases, the steepest descent version of LMS performs as well as Newton's method. The efficiency of adaptive algorithms with nonstationary input environments is analyzed where signals, jammers, and background noises can be of a transient and nonstationary nature. A new adaptive filtering method for broadband adaptive beamforming is described which uses both poles and zeros in the adaptive signal filtering paths from the antenna elements to the final array output. HC A03/MF A01 CSCL 20/14

The propagation of very low frequency (VLF) and low frequency (LF) radio waves in the Earth-ionosphere waveguide is affected profoundly by the Earth's curvature. In particular, for frequencies greater than about 20 kHz, some modes are possible for which the energy is concentrated near the base of the ionosphere and the field strength near the ground is small. It is useful to think of such modes as being composed of waves repeatedly reflected at the inside surface of the ionosphere. Using analogy with sound waves, we can call these modes whispering-gallery modes. Since they depend only very slightly on ground conductivity, these modes are also referred to as Earth-detached modes. The Navy currently is pursuing efforts leading to a feasibility demonstration of a balloon gateway communications system that would employ a balloon-to-balloon cross link based on the whispering-gallery propagation modes. This report discusses some recent whispering-gallery theoretical advances and simplifications. Author (GRA)

KAFJORD, NORWAY TRANSMISSION LINE VLF ANTENNA TESTS, 1979 - 1980

M. H. Dazey 15 Sep. 1981 41 p refs
(Contract F04701-80-C-0081; Grant NSF ATM-77-19361)
(AD-A106430; TR-0081(6960-06)-3; SD-TR-81-80) Avail: NTIS HC A03/MF A01 CSCL 17/2

The 100 kW Transportable Very-Low-Frequency (TVLF) system was used at Kafjord, Norway, for transmissions to the SCATHA and GEOS spacecraft. A 22 kV 14 km long transmission line was used as an antenna. Modifications were made in the line to reduce telephone interference, and components were designed and installed to reduce the resonant frequency and increase the antenna current. Final practical operating current was 40 amperes at 1280 Hz, which resulted in power dissipation of 72 kW and an estimated radiated power of 29 watts. Author (GRA)

WAVE PROPAGATION THROUGH AXIALLY SYMMETRIC DIELECTRIC SHELLS Final Technical Report, 12 Dec. 1979 - 30 Jun. 1981

G. Tricoles, E. L. Rope, and R. A. Hayward Jun. 1981 100 p refs
(Contract N00019-79-C-0638)
(AD-A106762; R-81-125) Avail: NTIS HC A05/MF A01 CSCL 17/9

Radomes significantly reduce missile guidance accuracy by producing boresight error (BSE), an error in target direction as determined by a seeker or radar system. Despite decades of development and use, radomes are a problem because newer missiles require small angular rates of change of BSE and because newer seekers have greater frequency bandwidths. The electromagnetic design process, for boresight error and bandwidth, is largely empirical because radome shapes are non-separable, making analysis approximate. The need for improving radome performance motivates efforts to improve analytical methods. The purpose of the research is to develop improved methods for analyzing radome electromagnetic effects. The main goals are as follows: Develop a geometric theory of diffraction (GTD) for dielectrics and in particular hollow dielectric shells. Extend the moment method for use with hollow dielectric shells. The GTD is intended to be relatively simple, and the moment method is intended to be accurate although more complex than the GTD. ANALYSIS OF MAXIMIN MATCHED-FILTER DESIGN FOR COMMUNICATION THROUGH A NONLINEARLY DISTORTING CHANNEL M.S. Thesis
Clifton J. Alston 1981 41 p refs
(AD-A106789; AFIT-CI-81-13T) Avail: NTIS
HC A03/MF A01 CSCL 17/2

This thesis describes a study of the problem of antipodal signalling through a nonlinearly distorting channel. Maximin design criteria are presented, and general expressions are derived for the robust filter and its performance in terms of the eigenfunctions and eigenvalues of certain additive noise autocorrelations. In particular, the results of baseband detection in triangular-kernel noise, ideally bandlimited noise, and the Wiever noise processes are presented. Author (GRA)

(AD-A106384; AEDC-TR-80-58) Avail: NTIS
HC A04/MF A01 CSCL 14/2

The multipole expansion coefficients needed to calculate transient electromagnetic fields and cavity frequency response in an internally excited, damped cavity are derived for an arbitrary but centralized distribution of source currents and an arbitrary number of dampers which have finite width. A block matrix procedure is devised to solve the N damper boundary value problems, but specific solutions are presented for the cases of zero, one, and two dampers. Also, the TM wave multipole coefficients for an uncapped biconical antenna used as excitation source are obtained in closed form, with use of Schelkunoff's mode solution for the antenna currents. Finally, coupled integrodifferential equations for the current distribution in the end caps and the conical sections of a capped bicone source are presented. This entire theory will be encoded to permit analysis of AEDC experiments. Author (GRA)

HC A08/MF A01 CSCL 17/2

Packet-switched networks are used primarily to handle data traffic, but considerable interest has recently been generated in extending packet-switching methods to also handle digitized voice traffic. New network control procedures are needed to deal with packetized voice traffic, as its characteristics are different from regular data traffic. We present two flow control algorithms which can be executed in a distributed manner to adjust source rates according to prevailing network conditions. Although the algorithms were developed for packet-voice networks, they are quite general and are applicable to many other systems. One algorithm is based on an optimization theoretic formulation of the flow control problem. The other has as its major premise a specific notion of fairness. Convergence is shown for both algorithms under static conditions. A program is developed which simulates the behavior of a general packet-switched network on an individual packet basis. It is used to examine the performance of the second flow control algorithm under realistic conditions. Author (GRA)

CSCL 20/14

An improved model is reported for the effect of surface roughness on coherent scatter of microwaves from moderately rough terrain and sea surfaces. This model gives agreement with microwave and acoustical experimental data for surface height standard deviations as much as 400% larger than for a widely accepted model discussed by Beckmann and other investigators. The improved agreement with data is achieved by assuming a symmetrical exponential probability density of the surface height random variable. This model lends itself to an interesting physical interpretation of the stochastic process associated with the surface profile. Author (GRA)

The U. S. Army Mobility Equipment Research and Development Command (MERADCOM) has been involved in a program for the development of an off-road mine detection system. In 1978, the Georgia Institute of Technology Engineering Experiment Station (GIT/EES) began a 36 month contract to gather and analyze radar data and investigate antenna designs with the goal of improving the ability to detect, discriminate and classify buried targets. The project included tasks of initial data analysis, antenna design and fabrication, extensive data collection, and algorithm development. Section 2 describes the data collection methods used with both the NBS measurement equipment and the MERADCOM short-pulse radar and a preliminary analysis of the data. Section 3 deals with the survey of candidate antennas, the design and fabrication of the 'best' choices, and the testing of those antennas. Test results for a cavity-backed spiral, and a broadband horn are presented and compared with a dipole antenna. Section 4 develops the discrimination concept using frequency spectra data and spartial correlation. Both FFT and MEM were used to obtain spectral data for comparison. The results of the discrimination algorithms are given. GRA

HC A04/MF A01 CSCL 20/14

Part 1: Scattering Cross Sections for Random Rough Surfaces - Full Wave Analysis. The full wave approach developed earlier to evaluate the radiation fields scattered by deterministic two dimensionally rough surfaces is used to determine the scattering cross sections for random rough surfaces. The medium below the irregular boundary is characterized by complex permittivity and permeability. For slightly rough surfaces, the full wave solutions for the incoherent scattered fields are shown to be in agreement with the perturbation solution. However, when the major contributions to the scattered fields come from the region of the rough surface around the stationary phase (specular) points, the full wave solutions are in agreement with the physical optics solutions. Thus, the full wave solutions which reduce the perturbation, the physical optics and the geometrical optics approximations in special cases, precisely determine the limitations of these approximations and reconcile the differences between them. Part 2: Scattering Cross Sections for Composite Random Surfaces - Full Wave Analysis. The full wave approach to rough surface scattering is applied to composite models of rough surfaces. In this work the principal distinguishing features of the individual rough surface is its correlation distance. Thus this model can be applied to scattering by rough seas as well as hilly terrain. COMSTAR SATELLITE 19/29 GHz PROPAGATION EXPERIMENT Final Report, 1977 - 1981

S. C. Bloch, D. Davidson, and D. D. Tang Aug. 1981 110 p refs Prepared in cooperation with GTE Labs., Inc., Waltham, Mass.
(Grant DAAG29-77-G-0224)
(AD-A108001; USF-PPL-45; ARO-15012.3-GS) Avail: NTIS HC A06/MF A01 CSCL 20/14

Results and analysis are presented for the 19/29-GHz satellite propagation experiments using beacons aboard the COMSTAR series. Emphasis is on diversity performance of the Tampa, Florida, Triad and single-site attenuation distributions in intense rain, and on single-site performance at Waltham, Massachusetts. The substantial data base evolved to show a flattish tail on distributions due to rapid rate-of-change at onset and recovery; this type of distribution found in Tampa rain environment was not found in Waltham. A MODEL TO CALCULATE EM FIELDS IN TROPOSPHERIC DUCT ENVIRONMENTS AT FREQUENCIES THROUGH SHF Final Report

Sherman Marcus and William D. Stuart Sep. 1981 236 p refs
(Contract F19628-80-C-0042)
(AD-A107710; ESD-TR-81-102) Avail: NTIS HC A11/MF A01 CSCL 20/14

Non-monotonic variations of the atmospheric refractivity with height often enable energy to be propagated in a duct mode with little attenuation over long distances. A duct model employing a waveguide-mode method of analysis was developed to calculate the field strength when the refractivity variation with height, is known. The developed numerical procedure methodically determines all significant eigenmodes for elevated and surface ducts at all frequencies through SHF. Computer model results for beyond-the-horizon ducts compare favorably with measurements taken at frequencies between 65 MHz and 3.3 GHz. GRA

METHOD TO TREAT PICTURE AND SOUND CARRIERS TO OBTAIN A CONSTANT AND ADJUSTABLE LEVEL SPACING BETWEEN THE PICTURE CARRIER AND THE SECOND CARRIER OF A TV SIGNAL WHEN THERE ARE VARIATIONS OF FIELD INTENSITY BETWEEN THE CARRIERS Final Report, Jan. 1980

Hans Hodapp and Peter Maier Bonn Bundesministerium fuer Forschung und Technologie Jan. 1981 80 p ref In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-041; ISSN-0340-7608) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 16,60

A procedure was investigated, allowing correction of the relation between the television (TV) picture carrier and the sound carrier of the IF range amplifier, realized with relatively small changes of the circuitry. The principle is based on adding to or substracting from the original sound carrier of the IF main signal the selected and treated sound carrier obtained via a bypass. The range of variation of the sound carrier level is + or - 12 db when compared with the picture carrier level. Errors of the amplitude and the group delay occuring in the video frequency part of the TV signal remain within the permissable tolerance of the standard specifications. Measurements of the AF signals show that harmonic distortions are 1%. Installations into the cable TV head-end unit prove its conformity to practical utilization. Author (ESA)

PERFORMANCE OF TELECOMMUNICATIONS SYSTEMS IN THE SPECTRAL-USE ENVIRONMENT. 6: ANALYTICAL RESULTS FOR LAND-MOBILE SCENARIOS IN CLASS B INTERFERENCE, WITH FADING AND MULTIPATH

David Middleton Jun. 1981 50 p refs
(Contract HO-A01-78-00-1158)
(PB81-249344; NTIA-CR-81-12) Avail: NTIS HC A03/MF A01 CSCL 17B

A canonical model of receiver performance for land-mobile systems is constructed, for Class B interference environments. The measure of performance is the probability of noninterference criterion (PNIC) Pa, with the desired signal (to the desired receiver) propagating according to a r to the minus 2 gamma power law, where the signal source (or intended receiver) performs a random walk vis-a-vis receiver (or source). Analytical evaluation of the PNIC is carried out, in terms of appropriately defined input signal-to-receiver noise ratios, for Class B EMI environments, which describe the correspondingly different nongaussian noise fields, including random walks with variances, and signals obeying general propagation and fading laws. Author

SOME CANONICAL APPROACHES TO THE EVALUATION OF TELECOMMUNICATION SYSTEM PERFORMANCE

David Middleton Jun. 1981 37 p refs
(Contract HO-A01-78-00-1158)
(PB81-249310; NTIA-CR-81-11) Avail: NTIS HC A03/MF A01 CSCL 17B

Canonical approaches for determining optimum receiver structure and performance in a variety of telecommunication applications are described. In particular, one aim of the present effort is to extend the more limited techniques of system evaluation based on signal-to-noise ratios, or on the probability of non-interference criterion, to the general decision-theoretic methods where the error probabilities (or probabilities of correct decisions) are used to contruct more realistic and complete measures of performance, and to obtain optimal systems as well. This is not generally possible at all input signal levels, but a canonical threshold, or weak-signal, theory is, which can be exploited to establish limiting bounds on performance, system comparisons, and structure insights into the required processing algorithms. A pair of parallel, spaced-apart circular ground planes define a microwave cavity with multi-port microwave power distributing switching circuitry formed on opposite sides of a thin circular dielectric substrate disposed between the ground planes. The power distributing circuitry includes a conductive disk located at the center of the substrate and connected to a source of microwave energy. A high speed, low insertion loss switching diode and a dc blocking capacitor are connected in series between the outer end of a transmission line and an output port. A high impedance, microwave blocking dc bias choke is connected between each switching diode and a source of switching current. The switching source forward biases the diodes to couple microwave energy from the conductive disk to selected output ports and, to associated antenna elements connected to the output ports to form a synthesized antenna pattern.

Test data were collected on 1035 plastic encapsulated devices and 75 hermetically scaled control group devices that were purchased from each of five different manufacturers in the categories of (1) low power Schottky TTL (bipolar) digital circuits; (2) CMOS digital circuits; (3) operational amplifier linear circuits; and (4) NPN transistors. These parts were subjected to three different initial screening conditions, then to extended life testing, to determine any possible advantages or trends for any particular screen. Several tests were carried out in the areas of flammability testing, humidity testing, high pressure steam (auroclave) testing, and high temperature storage testing. Test results are presented. Procurement and application considerations for use of plastic encapsulated semiconductors are presented and a statistical analysis program written to study the log normal distributions resulting from life testing is concluded. In the area of narrowband signal processing, design rules are developed for optimum decimator and interpolator, a new efficient scheme using recursive filter for decimation/interpolation is proposed, and a novel approach to the computation of narrowband spectra is shown to yield substantial saving over conventional approaches. Results on the implementation of recursive filters with poles near the unit circle that produces significantly reduced roundoff error include a transformation technique, a scheme to modify the quantizer error spectrum, and a new computationally efficient low noise filter structure. In the area of nonclassical signal detection, several results were derived on nonparametric sequential procedures and on the quantization of signal for detection. In addition, a programmable charge transfer device filter is developed, several problems concerning ADPCM are investigated, results are obtained on FFT roundoff error including the prime factor algorithm, and an effective method of generating random sequences is studied. This report describes the development of GaAs MESFET power amplifiers at 21 GHz. Techniques for making large-signal loadpull and 'S' parameter measurements at these frequencies, and the measured device characteristics are presented. A unique method of obtaining accurate gain and power measurements is discussed. Design methods and data are presented on 21 GHz amplifiers with more CW power and higher efficiency than previously achieved. Author (GRA)

Algorithms that manipulate sets of rectangles are of great practical importance in VLSI design systems and other applications. Although much theoretical work has appeared recently on the complexity of rectangle problems, it has assumed that the inputs are given as a list of rectangles. In this paper we study the complexity of rectangle problems when the inputs are given in a hierarchical language that allows the designer to build large designs by replicating small designs. We will see that while most of the problems are NP-hard in the general case, there are O(N lg N) algorithms that process inputs obeying certain restrictions. Author (GRA)

A process has been established for fabricating In.53Ga.47As JFETs on InP substrates that is capable of making JFETs with small gate lengths (almost equal to 0.5 micrometer), low source resistance (2 omega), low gate series resistance (2 omega), low gate series resistance (< 4 omega), negligible 'sidewall' capacitance, and low gate leakage current (approximately 100 nA). The process involves a shallow localized Zn diffusion and a controlled etch using the gate metal as a mask. The effective gate length is somewhat smaller than the gate metal 'length', thus facilitating the formation of submicron gates. At modest reverse-bias gate voltages, these JFETs have g sub m values approching twice that which would be expected for corresponding GaAs MESFETs. However, near zero-gate bias, there is substatial g sub m compression, perhaps arising from defects associated with the Zn-diffusion process. Further devise optimization is still required along the lines of increasing channel doping, decreasing gate length, and developing improved diffusion processes (e.g., ion-implantation). Optimized In.53Ga.47As JFETs will probably outperform even the best GaAs MESFETs. GRA

(DE81-028745; LA-UR-81-2119; CONF-811112-11) Avail: NTIS HC A02/MF A01

Foil edge partial discharge phenomena in high energy density, spirally wound capacitors were investigated. A partial discharge dependency on voltage found to exist in liquid impregnated, laminar plastic film dielectric structures. Experiments support the hypothesis that electric charges are injected into the dielectric regions heat the foil edge by field controlled charge objectives during impressed voltage transients. The resulting conduction current space charge can establish equilibrium by reduction of the electric field intensity below the partial discharge inception threshold. A temporal characterization of this space charge injection is discussed relative to the effect on partial discharge inception at the foil edge. DOE

(PB82-109307; MTR-80W274; UMTA-VA-06-0056-81-1) Avail: NTIS HC A06/MF A01 CSCL 13F

An overview of the current status of electric motors with potential applications in automated guideway transit (AGT) systems is presented. Direct current (dc) motors are surveyed, and induction, synchronous, and linear electric motors reviewed. Performance characteristics of typical state of the art dc and induction motors are provided. Current work on improved and advanced designs of rotary and linear motors is also reviewed. It is concluded that performance requirements of existing AGT concepts can be satisfied with available technology traction motors, conventional dc motors with switched power supplies will continue to be the most widely used motor for traction application, and solid state devices are a major factor in achieving improved motor performance Author (GRA)

A MODIFIED DODGE ALGORITHM FOR THE PARABOLIZED NAVIER-STOKES EQUATION AND COMPRESSIBLE DUCT FLOWS Final Report, 15 Apr. 1978 - 30 Nov. 1981

C. H. Cooke Dec. 1981 34 p refs

(Grant NsG-1517)

(NASA-CR-165080) Avail: NTIS HC A03/MF A01 CSCL 20D

A revised version of Dodge's split-velocity method for numerical calculation of compressible duct flow was developed. The revision incorporates balancing of mass flow rates on each marching step in order to maintain front-to-back continuity during the calculation. The (checkerboard) zebra algorithm is applied to solution of the three dimensional continuity equation in conservative form. A second-order A-stable linear multistep method is employed in effecting a marching solution of the parabolized momentum equations. A checkerboard iteration is used to solve the resulting implicit nonlinear systems of finite-difference equations which govern stepwise transition. Qualitive agreement with analytical predictions and experimental results was obtained for some flows with well-known solutions. Author

A COMPREHENSIVE MODEL TO DETERMINE THE EFFECTS OF TEMPERATURE AND SPECIES FLUCTUATIONS ON REACTION RATES IN TURBULENT REACTING FLOWS Semiannual Status Report, 1 Aug. 1981 - 31 Jan. 1982

E. Foy, G. Ronan, and W. Chinitz 31 Jan. 1982 77 p refs

(Grant NAG1-18)

(NASA-CR-165108) Avail: NTIS HC A05/MF A01 CSCL 20D

A principal element to be derived from modeling turbulent reacting flows is an expression for the reaction rates of the various species involved in any particular combustion process under consideration. A temperature-derived most-likely probability density function (pdf) was used to describe the effects of temperature fluctuations on the Arrhenius reaction rate constant. A most-likely bivariate pdf described the effects of temperature and species concentrations fluctuations on the reaction rate. A criterion is developed for the use of an 'appropriate' temperature pdf. The formulation of models to calculate the mean turbulent Arrhenius reaction rate constant and the mean turbulent reaction rate is considered and the results of calculations using these models are presented. A.R.H.

CRITICAL PARAMETERS FOR DETONATION PROPAGATION AND INITIATION OF SOLID EXPLOSIVES
Donna Price 10 Sep. 1981 105 p refs
(AD-A106485; NSWC/TR-80-339) Avail: NTIS HC A06/MF A01 CSCL 19/1

The complicated relations and interdependence of the various critical parameters are demonstrated. In particular, the critical diameter is determined by charge temperature, initial particle size, density, confinement, composition, and shock sensitivity. The critical initiating pressure is also a multivariant function and depends on the same set of variables. Relations between different gap (shock sensitivity) test results and between those of gap and wedge tests are also shown. Author (GRA)

USE OF THE PITOT TUBE IN VERY LOW DENSITY FLOWS Final Report, Feb. 1964 - Jan. 1981
W. B. Stephenson AEDC Oct. 1981 34 p refs Sponsored by AF
(AD-A106374; AEDC-TR-81-11) Avail: NTIS HC A03/MF A01 CSCL 14/2

The cryogenically pumped vacuum chamber has made it possible to generate gas dynamic flows of much lower density than conventional wind tunnels. In the process of calibrating these flows since 1964, pitot tube data have been obtained in a regime that corresponds to very high altitude flight, low Reynolds numbers (< 100/cm), or high Knudsen numbers (mean-free-path > 40X pitot diameter). Under these conditions, pitot pressures may be four times the inviscid stagnation pressure. Therefore, a substantial correction must be applied to the measured pitot tube data to use it for gas stream calibrations. The available pitot data are correlated in concise form with Reynolds number evaluated behind a normal shock, Re2, and total temperature as a parameter. The physical variables are combined in a form of presentation that permits direct determination of stream properties in nozzle or free-jet expansions without the usual successive approximations. The data are presented in a form that permits selection of pitot tube size, transducer range, and applicability of the instrument in specific flow conditions. The use of the pitot tube to survey the rarefied flow of jet from a rocket motor in a space chamber is discussed. The low density nozzles used in Aerospace Chamber (10V) are probably unique in the low density limit, and the pitot pressure data provide an insight into the gas dynamics of rarefied flows. GRA

FLUID MECHANICS AND HEAT TRANSFER SPIRALLY FLUTED TUBING
J. C. LaRue, P. A. Libby, and J. S. Yampolsky Aug. 1981 57 p refs
(Contract N00014-79-C-0773)
(AD-A107983; GA-A-16541) Avail: NTIS HC A04/MF A01 CSCL 20/4

The objective of this program is to develop both a qualitative and a quantitative understanding of the fluid mechanics and heat transfer mechanisms that underlie the measured performance of the spirally fluted tubes under development at General Atomic. The reason for the interest in the spirally fluted tubes is that results to date have indicated three advantages to this tubing concept: The fabrication technique of rolling flutes on strip and subsequently spiralling and simultaneously welding the strip to form tubing results in low fabrication costs, approximately equal to those of commercially welded tubing. The heat transfer coefficient is increased without a concomitant increase of the friction coefficient on the inside of the tube. In single-phase axial flow of water, the helical flutes continuously induce rotation of the flow both within and without the tube as a result of the effect of curvature. An increase in condensation heat transfer on the outside of the tube is achieved. In a vertical orientation with fluid condensing on the outside of the helically fluted tube, the flutes provide a channel for draining the condensed fluid. GRA

A PREDICTION METHOD FOR TURBULENT BOUNDARY LAYERS IN ADVERSE PRESSURE GRADIENTS
W. H. Schofield Feb. 1981 57 p refs
(AD-A107849; ARL/MECH-ENG-NOTE-385) Avail: NTIS HC A04/MF A01 CSCL 20/4

A prediction method for turbulent boundary layers in moderate to strong adverse pressure gradients is presented. The closure hypothesis for the method is the universal velocity defect law of Schofield and Perry (1972) which restricts the method to the prediction of layers in moderate to strong adverse pressure gradient. The method is tested against nine experimentally measured boundary layers. Predictions for velocity profile shape, boundary layer thicknesses and velocity scale ratio were generally in good agreement with the experimental measurements and were superior to those given by other prediction methods. Unlike other methods the present method also gives reasonably accurate predictions for the shear stress profile of a layer. The analysis presented is compared with previous work and helps to resolve some disagreements discerned in the literature. GRA

AN EXPERIMENTAL STUDY OF FORCED ASYMMETRIC OSCILLATIONS IN A ROTATING LIQUID-FILLED CYLINDER Final Report
Richard D. Whiting Oct. 1981 85 p refs
(DA Proj. 1L1-61102-AH-43)
(AD-A107948; ARBRL-TR-02376) Avail: NTIS HC A05/MF A01 CSCL 20/4

An experimental study was made of forced asymmetric oscillations in a liquid-filled, rapidly-rotating, right circular cylinder. Oscillations were forced by causing the cylinder to cone about an axis passing through the center of the cylinder but offset by a small angle from the axis of rotation: the motion is similar to precession of a gyrostat but constrained to fixed frequency and amplitude. The fluctuating pressure response of the liquid in the cylinder was measured using pressure transducers mounted in an end wall. Fluctuating pressure was measured for non-dimensional coning frequencies of .030 to .075, for coning angles of .00018 x .035 radians, and for Reynolds numbers of 5,000 to 500,000. Comparisons were made to existing linear theories of the liquid response. The results agreed with theoretical predictions at the highest Reynolds number, and smallest angles. At the smallest Reynolds number, the data agreed better with the solution of a forced oscillation problem than with the solution of a free oscillation problem. At coning angles as small as .0005, the data showed significant departure from the predictions of linear theory, and at coning angles as small as .0008, the liquid exhibited nonstationary behavior suggestive of a flow instability. SIMPLE COMPUTER PROGRAM TO MODEL 3-DIMENSIONAL UNDERGROUND HEAT FLOW WITH REALISTIC BOUNDARY CONDITIONS

P. D. Metz 1981 13 p refs Presented at the Am. Soc. of Mech. Engrs. Winter Ann. Meeting ASME Solar Energy Div., Washington, D.C., 15-20 Nov. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030213; BNL-29776; CONF-811101-11) Avail: NTIS HC A02/MF A01

A FORTRAN computer program called GROCS (GRound Coupled Systems) has been developed to study 3-dimensional underground heat flow. Features include the use of up to 30 finite elements or blocks of Earth which interact via finite difference heat flow equations and a subprogram which sets realistic time and depth dependent boundary conditions. No explicit consideration of mositure movement or freezing is given. GROCS has been used to model the thermal behavior of buried solar heat storage tanks (with and without insulation) and serpentine pipe fields for solar heat pump space conditioning systems. The program is available independently or in a form compatible with specially written TRNSYS component TYPE subroutines. The approach taken in the design of GROCS, the mathematics contained and the program architecture, are described. Then, the operation of the stand-alone version is explained. Finally, the validity of GROCS is discussed. DOE

STUDY OF NON-DARCY NATURAL CONVECTION FROM A VERTICAL HEATED SURFACE IN A SATURATED POROUS MEDIUM

J. C. Huenefeld and O. A. Plumb 1981 8 p ref Presented at the 20th Natl. Heat Transfer Conference, Milwaukee, 2 Aug. 1981; sponsored by ASME
(Contract DE-AC06-76RL-01830; Grant NSF ENG-78-20145)
(DE81-030081; PNL-SA-9712; CONF-810804-17; Rept-81-HT-45) Avail: NTIS HC A02/MF A01

Experimental investigation of the buoyancy induced boundary layer adjacent to a vertical uniformly heated foil imbedded in a saturated porous medium is described. Temperature profiles were measured for Rayleigh numbers ranging from 136 to 4640 corresponding to Reynolds numbers based on the particle diameter of from 0.85 to 10.5. For Reynolds numbers in excess of 3, the temperature profiles exhibit spatial and temporal fluctuations. The discrepancy in heat transfer is in part attributed to non-Darcy effects. The effect of the permeability increase at the wall/porous medium interface is qualitatively examined for different size particles. The results indicate that the wall effect is a strong function of particle diameter. DOE

EFFECTS OF GAS-FLOW PATTERN ON CAVITY SHAPE

John R. Creighton 22 Jul. 1981 16 p refs Presented at the 7th Ann. Underground Coal Conversion Symp., Fallen Leaf Lake, Calif., 7-11 Sep. 1981
(Contract W-7405-eng-48)
(DE82-000347; UCRL-85907; CONF-810923-10) Avail: NTIS HC A02/MF A01

The effects of different gas flow patterns on the cavity shape in laboratory scale coal block experiments are shown. The burning of pure carbon is modeled. The rate of removal of carbon from the cavity wall is shown to depend on the local rate of oxygen transport to the wall. A numerical model which assumes plug flow in the cavity with a laminar boundary layer gives cavities shaped like an exponential horn, with the largest radius next to the inlet. The downstream shape is in reasonable agreement with experiment. When cavity flow is calculated using the full Navier-Stokes equations the flow near the inlet resembles an expanding jet surrounded by a torroidal vortex. The maximum rate of oxygen transport to the wall occurs where the jet strikes the converging cavity wall some distance downstream. The reduced oxygen transport near the inlet causes the upstream portion of the cavity to be rounded. The downstream portion of the cavity is similar to that with plug flow. DOE

THE ARL/FED ANECHOIC CHAMBER

R. C. Marboe and J. M. Fitzgerald 4 Aug. 1981 32 p refs
(Contract N00024-81-C-6043)
(AD-A106352; ARL/PSU-TM-81-164) Avail: NTIS HC A03/MF A01 CSCL 14/2

This report documents the design and acoustic characteristics of the Applied Research Laboratory Department anechoic chamber. It is located on the above-console deck of the Garfield Thomas Water Tunnel situated so as to allow its use in conjunction with the Axial Flow Research Fan (AFRF). The internal free dimensions of the chamber are 2.74 x 3.05 x 1.98 meters (9 x 10 x 6.5 ft.). The sound absorbing walls are composed of polyurethane foam acoustic wedges, air voids, embossed acoustic foam wall lining, plywood and wood frame members. Air intake ducts, baffled and lined with a lead-foam sheet, provide an adequate air volume for the AFRF. Based on measurements of transmission loss and inverse square law, the chamber is considered anechoic for frequencies above 230 Hz and semi-anechoic for lower frequencies. GRA

DUAL POLARIZATION FIBER OPTIC GYRO Final Report, 1 Oct. 1980 - 30 Sep. 1981

Joel G. Hanse, Robert B. Smith, and Gordon L. Mitchell 30 Oct. 1981 91 p refs
(Contract N00173-80-C-0344)
(AD-A106731; HONEYWELL-81SRC75) Avail: NTIS HC A05/MF A01 CSCL 17/7

This report presents results from a Naval Research Laboratory-sponsored investigation of dual polarization gyros. The dual polarization concept is a new fiber optic gyro configuration designed to provide independence from principal gyro bias error sources. Experimental results indicate an order of magnitude improvement in bias error performance. Important results from a new modeling capability are also included. In addition to examination of dual polarization gyro performance, a number of

fiber gyro configurations have been examined. Results of this effort include development of an improved understanding of fiber optic depolarizers and identification of a previously unreported error team for gyros using 3 dB distributed couplers.

THE 403 MHz SAW OSCILLATOR Final Report
D. J. Dodson Fort Monmouth, N.J. ERADCOM Nov. 1981 83 p
(Contract DAAK20-80-C-0260)
(AD-A107588; DELET-TR-80-0260-F) Avail: NTIS HC A05/MF A01 CSCL 09/5

This contract provides for a sixteen month program for the investigation and exploratory development of a 200 mW, SAW stabilized oscillator which can be frequency and amplitude modulated. The oscillator is to have its center frequency at 403 MHz and be tunable over a + or - 3MHz bandwidth. Trade-off design studies have been performed to determine techniques which will provide the most effective interaction of essential oscillator components, i.e., SAW delay-line, phase shifter, coupler and amplifier, to provide a high degree of frequency stability. A significant effort was made to implement the required circuit functions in a low-cost printed circuit approach rather than utilize high-cost commercially available components, since the oscillator is intended for use in an expendable application.

THEORY OF A MODIFIED WADSWORTH MONOCHROMATOR MATCHED TO A LOW ENERGY STORAGE RING SOURCE
Malcolm R. Howells 1981 21 p refs Presented at the 2nd Natl. Conf. on Synchrotron Radiation Instrumentation, Ithaca, N.Y., 15 Jul. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030034; BNL-29838; CONF-810750-3) Avail: NTIS HC A02/MF A01

The concave diffraction grating in the Wadsworth mounting has been popular with synchrotron radiation spectroscopists because of its use of parallel light. This is well matched to experimental stations which are a great distance away from the source as would be the case in using a high energy synchrotron. For low energy storage rings the working distance is quite small and in this case it is appropriate to use a collimating mirror. Large collection angles are possible with this arrangement and reasonable resolution can be obtained using spherical surfaces. Astigmatism is much lower than for Rowland circle mountings. These questions are analyzed using an optical path function development and calculations are presented which include the aberrations both in the two optics and those caused by the large extension of the source in the direction of the radiation emission.

VENTURI DESIGN FOR METERING SOLIDS FLOW IN GAS-SOLIDS SUSPENSIONS Semiannual Progress Report
C. T. Crowe 31 Sep. 1981 30 p
(Contract DE-FG22-80PC-30212)
(DE81-031944; DOE/PC-30212/T2) Avail: NTIS HC A03/MF A01

The possibility of extending the usefulness of the Venturi as a gas/solids meter to larger particle sizes by modifying the inlet geometry was investigated. The adaptability of the annular Venturi to meter gas-solids flows in length-constrained systems has also been investigated. The optimal inlet geometry to maximize the Venturi sensitivity to loading was identified. Laser light attenuation across the throat section of the venturimeter was carried out to determine if such measurements could provide an independent measure of solids loading in the gas/solids suspension.

(Contract DI-BM-HO-282926)
(PB81-243246; BM-OFR-116-81) Avail: NTIS HC A02/MF A01 CSCL 14C

Two tape recording and triggering systems were developed and delivered for use in the microseismic program. The systems are designed to improve the effectiveness of the Sangamo 3500 series and SABRE VI instrumentation tape recorders. The system is designed to capture random microseismic data, digitize and temporarily store these data, start the tape recorder, and then transfer the data to magnetic tape for permanent storage. The system is designed to pack data on tape such that the tape may be simply played back through galvo drives onto an oscillograph such that a continuous series of analog records, with corresponding time of day information, are reproduced without excessive oscillograph paper waste or the need for the operator to search for valid events.

A prototype crash recorder measuring and storing time histories of vehicle lateral and longitudinal accelerations, during a collision was designed, fabricated, and subjected to environmental tests. The recorder features low cost accelerometers, signal conditioning circuitry, A/D converter, microprocessor and digital storage. Accelerometer outputs are continuously sampled and stored in digital memory. The microprocessor monitors Delta V and compares it to a selectable criterion. When Delta V exceeds the criterion recent acceleration time histories are permanently stored in memory. The stored signals include acceleration data prior to and subsequent to the crash event. Methods of implementing the recorder including discussion of distribution in vehicle fleets, data retrieval, including hardware and software, and data processing software are provided. DOE

ACOUSTICAL CONCEPT FOR MEASURING PARTICLE SIZE DISTRIBUTIONS
David S. Mahler Feb. 1981 74 p refs
(Grant NSF DAR-80-09595)
(PB81-235301; NSF/DMR-81001) Avail: NTIS HC A05/MF A01 CSCL 14B

A device for measuring particle size and distribution for air pollution control applications was investigated. The Acoustic Particulate Monitor, can measure total mass loading, mean particle diameter, and width of particle size distributions on an in-situ basis. It is based on observations that the presence of dust in air causes a reduction in the speed of sound as a function of transmitted frequency. Reductions in sound speed are small and the accompanying shift in the acoustical phase is a highly sensitive method for detecting such effects. Magnitudes of phase shift are related to mass loading. The frequency associated with maximum phase shift is defined as the acoustic frequency, fA. Experimentally determining fA provides a measure of the mean particle size of the distribution. Experimental results were verified using direct mass measurements and microphotographs. GRA

CRYOGENIC FLUIDS DENSITY REFERENCE SYSTEM: PROVISIONAL ACCURACY STATEMENT (1980)
J. D. Siegwarth and J. F. LaBrecque Apr. 1981 61 p refs Sponsored by Gas Research Inst.
(PB81-244865; NBS-TN-1041) Avail: NTIS HC A04/MF A01 CSCL 14B

An improved Density Reference System, reference densimeter, and method of determining sample density are described. The uncertainty of the density reference system is + or -0.055 percent. The contribution from the estimated systematic error in density was + or -0.022 percent. The estimated uncertainty caused by random error is three times the standard deviation of 0.011 percent and is based on measurements of densities of saturated liquid methane. Total density uncertainty is the sum of the systematic and random errors for a density range of 400 to 480 kg/cu m at pressures from 0.8 to 4 bar absolute and temperatures between 109 and 128 K. This accuracy statement is expected to apply over ranges of at least 400 to 1000 kg/cu m in density, 77 to 300 K in temperature and 0.8 to 7 bar in pressure. This system has great accuracy, speed, reliability, and flexibility. GRA

Wire-wrapped frame assemblies used in spark chambers and the like can be measured using a system which utilizes a laser, an interferometer, and a retroreflector to precisely measure distance. A light source and a photodetector are located adjacent the incremental assembly and mounted on a movable carriage. The interferometer is also mounted on the movable carriage, while the laser and retroreflector are positioned at either end of the carriage track. The carriage is moved along one edge of the incremental assembly between the retroreflector and the laser, and as the carriage is moved, the light from the light source to the photodetector is interrupted. This produces a trigger command to a control unit which in turn causes a distance measurement to be made. A printout is provided for each sampling trigger command to list such items as ideal position, actual position and amount of error.

NON-LINEAR ANALYSIS OF THE FREE ELECTRON LASERS UTILIZING A LINEAR WIGGLER FIELD Interim Report
Cha-Mei Tang and P. Sprangle 19 Oct. 1981 35 p refs
(DARPA Order 3817)
(AD-A106229; NRL-MR-4354) Avail: NTIS HC A03/MF A01 CSCL 20/5

A one dimensional steady state (FEL) amplifier, utilizing a linearly polarized magnetic wiggler field, is analyzed in the linear and non-linear operating regimes. Our formulation of the FEL problem includes all the efficiency enhancements schemes, electron beam thermal effects and collective effects, i.e., space charge waves. The axial electron velocity, due to a linearly polarized wiggler field, has a spatially oscillatory component. It is shown that this axial velocity jiggle does not result in phase incoherence between the electrons and the ponderomotive wave. The axial velocity jiggle is explicitly incorporated into our analytical model. The inclusion of the electron jiggle velocity is shown to have a quantitative effect on the non-linear wave particle dynamics. The electron trapping potential associated with the ponderomotive wave is also derived. Finally, a number of numerical examples pertinent to the design of a 10 micron FEL amplifier are presented. RATE ENHANCEMENT RESULTING FROM REAGENT VIBRATIONAL EXCITATION AS ESTIMATED BY THE BEBO METHOD
Norman Cohen and Stanley W. Mayer 1 Sep. 1981 27 p refs
(Contract F04701-80-C-0081)

(AD-A106431: TR-0081(6940-01)-1: SD-TR-81-64) Avail: NTIS HC A03/MF A01 CSCL 20/5

The bond-energy bond-order (BEBO) method for calculating rate coefficients and activation energies on the basis of molecular properties has been applied to estimating rate coefficients and activation energies for H-transfer reactions involving vibrationally excited reactants. The reactions examined included Br + H2(v equals 0, 1) equals H + HBr, Br + HC1(v equals 0, 1, 2) equals C1 + HBr, and F + HC1(v equals 0, 1) equals C1 + HF. Good agreement was obtained between the computed BEBO rate coefficients and published rate coefficients. It is important to note that the rate enhancement resulting from vibrational excitation could be explained for most of the reactions as being largely caused by the lower bond dissociation energy of the vibrationally excited reagent. Because of the significance of vibrational de-excitation rates in chemical lasers, BEBO computations were made for HF and DF deexcitation by reactions with H, D, F, and other atoms. The highest computed deexcitation rate coefficients were those involving reactions with F-atoms. Reagent vibrational excitation to v equals 10 was examined. Computations were also made to estimate rate coefficients for several possible deuterium isotope separation methods based on the use of vibrationally excited reactants. Author (GRA)

VIBRATIONAL RELAXATION OF DF (V=1 AND 3) IN H2, D2, N2, AND HF AT 200 K
J. F. Bott 1 Sep. 1981 24 p refs
(Contract F04701-80-C-0081)
(AD-A106142: TR-0081(6603)-1: SD-TR-81-66) Avail: NTIS HC A02/MF A01 CSCL 20/5

The laser-induced fluorescence technique was used to measure the rate coefficients for the deactivation of DF(v = 1) and DF (v = 3) in H2, D2, N2, and HF at 200 + or - 5 K. The rate coefficients for deactivation by H2, N2, and HF were found to scale with v as v to the 1.9 + or - 0.1 power, essentially the same as the scaling at 295 K. The relaxation rates for DF(v = 1) were compared with data obtained at higher temperatures. At 200 K, the exchange probability of HF(1) + H2(0) was the same as that of DF(1) + D2(0) (within 10%) when the endothermicities were considered. Author (GRA)

LASER KINETIC SPECTROSCOPIC STUDIES (A) THE UNIMOLECULAR REACTIONS OF NITROALKANES AND, (B) ELEMENTARY REACTIONS IMPORTANT IN COMBUSTION Annual Progress Report, 1 Jan. - 31 Aug. 1981
R. C. Estler, H. Reisler, and C. Wittig 31 Aug. 1981 37 p refs
(Contract N00014-80-C-0539)
(AD-A107820) Avail: NTIS HC A03/MF A01 CSCL 20/5

The multiphoton ionization (MPI) of NO is used to probe the dynamics of the photodissociation of NO2 in a one-color experiment. The resulting MPI spectra clearly indicate the high internal rotational energy in the NO fragment. MPI shows promise as a highly-sensitive, information-rich diagnostic for internal state determinations of nitric oxide. We report that the 300 K reaction of C2H with O2 has as one of its product channels CH + CO2. By monitoring time resolved CH chemiluminescence following laser photolysis production of C2H in the presence of O2, we have measured rate coefficients for reactions of C2H with O2, H2, and CH4. GRA

NANOSECOND AND PICOSECOND SPECTROSCOPY AND KINETICS OF DYNAMIC ABSORBING MATERIALS Final Report, Jun. 1976 - Jun. 1981
Maurice W. Windsor 8 Oct. 1981 132 p refs
(Grant DAAG29-76-G-0275)
(AD-A107733: ARO-14081.11-C) Avail: NTIS HC A07/MF A01 CSCL 20/5

There is an increasing need to provide protection for both personnel and electronic sensors against laser radiation in the visible and near infra-red regions. The proliferation of laser frequencies and the advent of tunable lasers combine to create a threat that static filters alone cannot combat. Dynamic filters that become highly absorbing only on exposure to the incident laser radiation would provide an attractive solution, especially if the dynamic absorption could be made to develop very rapidly and also be rapidly reversible after the laser pulse is over. This report describes research aimed at the further development of ultra-fast spectroscopic instrumentation constructed in the author's laboratory and its application to studying several phenomena capable of giving rise to dynamic absorption in selected classes of chemical compounds. These phenomena include the direct photoproduction on the picosecond time scale of absorbing transient species such as excited singlet states and excited triplet states of conjugated organic molecules and dyes, the production of radical ions of similar compounds via photoexcitation followed by fast electron transfer and the production of various excited states of inorganic complexes. A low-cost automated, picosecond laser spectrometer based on a two-dimensional optical multichannel analyzer (OMA) interfaced to a home assembled microcomputer has been developed. GRA

ENERGETICS AND COLLISION DYNAMICS OF ELECTRONIC TRANSITION LASERS Final Report, 1 Aug. 1980 - 31 Jul. 1981
H. Harvey Michels and R. H. Hobbs Sep. 1981 46 p refs
(Contract F49620-80-C-0095: AF Proj. 2303)
(AD-A107591: UTRC-R81-925293: AFOSR-81-0750TR) Avail: NTIS HC A03/MF A01 CSCL 20/5

Knowledge of the partition of energy between the products of a chemical reaction is fundamental to understanding the dynamics of collisional reactions. Atom-atom and atom-molecule reactions that yield vibrationally excited diatomic molecules are of particular scientific and military interest. An understanding of the dynamics of these reactions and of at least limited regions of potential energy surfaces is important in analyzing and predicting vibrational and rotational relaxation rates. A program to develop theoretical techniques and construct computer programs for calculating potential energy surfaces and kinetic cross sections for calculating potential energy surfaces and kinetic cross sections for simple collision processes is discussed. The potential energy surfaces of concern include both atom-atom and atom-diatom systems with special emphasis on molecular reactions yielding electronically excited products which have potential as visible or UV chemical lasers. These systems include metal oxides and halides, metal excimers and the noble gas-halides. GRA

RECYCLABILITY ISSUES IN XeF LASERS Final Technical Report, 15 Jun. 1980 - 15 Apr. 1981
A. Mandl, R. Slater, and D. Trainor Wright-Patterson AFB, Ohio AFWAL Aug. 1981 60 p refs
(Contract F33615-80-C-2060: AF Proj. 2301: AF Proj. 3938)
(AD-A107759: AFWAL-TR-81-2085) Avail: NTIS HC A04/MF A01 CSCL 20/5

This report describes three experiments designed to assess various aspects of XeF laser operation at elevated temperatures. Measurements of the rate of loss of NF3 and NF2 in contact with metals and quartz were obtained in one experiment. Nickel, quartz and aluminum appear to be less reactive than titanium, stainless steel and copper. The feasibility of using metal-filled reactors to scrub F2 from XeF laser gas mixtures was investigated. Titanium was shown to be a selective F2 scrubber. XeF laser performance was studied as a function of NF3 and NF2 mole fractions. These experiments indicate that the presence of NF2 degrades laser performance using a stainless steel cell. The cell construction material appears to play a significant role in determining the extent of degradation. Author (GRA)

(Contract DE-AC08-78DP-40030)
(DE81-029627; KMSF-U-1109; CONF-810651-7) Avail: NTIS HC A02/MF A01

The laser irradiated gas jet soft X-ray source in scattering processes was studied. It is a reproducible and stationary source with large yield and plasma properties characterized by conventional diagnostic techniques. X-ray pinhole photographs show an axially symmetric radiating plume located at the electron density critical surface. The density gradient is obtained by holograhic interferometry using a 0.26 microwavelength probe pulse. Electron temperatures are determined by spatially resolving X-ray crystal spectroscopy to record and analyze line emission from H and He like configurations. DOE

An assembly is disclosed for sealing a variable gap between the surface of element and a second element in movable relation to it. A seal housing is attached to the second element for movement therewith and has a sealing surface. At least one elongated seal member carried by the housing has first and second conjugate sealing surfaces. The first sealing surface is for rubbing and sealing engagement with the first element surface and the second sealing surface is for sliding and sealing engagement with the housing sealing surface. A biasing assembly may be carried by the housing for biasing the first and second conjugate sealing surfaces of the sealing member toward sealing engagement with the first element surface and housing sealing surface, respectively.

(Contract DEN3-35; EC-77-A-31-1011)
(NASA-CR-165226; DOE/NASA/0035-1) Avail: NTIS HC A09/MF A01 CSCL 13I

The results of traction tests performed on two fluids are presented. These tests covered a pressure range of 1.0 to 2.5 GPa, an inlet temperature range of 30 °C to 70 °C, a speed range of 10 to 80 m/sec, aspect ratios of .5 to 5 and spin from 0 to 2.1 percent. The test results are presented in the form of two dimensionless parameters, the initial traction slope and the maximum traction peak. With the use of a suitable rheological fluid model the actual traction curves measured can now be reconstituted from the two fluid parameters. More importantly, the knowledge of these parameters together with the fluid rheological model, allow the prediction of traction under conditions of spin, slip and any combination thereof. Comparison between theoretically predicted traction under these conditions and those measured in actual traction tests shows that this method gives good results. Author

SMALL PASSENGER CAR TRANSMISSION TEST: CHEVROLET MALIBU 200C TRANSMISSION WITH LOCKUP
M. P. Bujold Aug. 1981 245 p refs
(Contracts DEN3-124; DE-AI01-77CS-51044)
(NASA-CR-165182; DOE/NASA/0124-6; ERC-TR-8125) Avail: NTIS CSCL 13F

The small passenger car transmission test was initiated to supply electric vehicle manufacturers with technical information regarding the performance of commercially available transmissions. This information would enable EV manufacturers to design a more energy efficient vehicle. With this information the manufacturers would be able to estimate vehicle driving range as well as speed and torque requirements for specific road load performance characteristics. This report covers the testing of a Chevrolet Malibu 200C automatic transmission with lockup. The transmission was tested in accordance with a passenger car automatic transmission test code (SAE J651b) which required drive performance, coast performance, and no load test conditions. Under these test conditions, the transmission attained maximum efficiencies in the mid 90 percent range both for drive performance test and coast performance tests. The torque, speed and efficiency curves map the complete performance characteristics for the Chevrolet Malibu 200C automatic transmission with lockup.

EFFECT OF SEALS ON ROTOR SYSTEMS
David P. Fleming 1982 18 p refs Presented at the 52nd Shock and Vibration Symp., New Orleans 27-29 Oct. 1981; sponsored by NRL and the Machinery Vibration Monitoring and Anal. Meeting, Oak Brook, Ill., 30 Mar. - 1 Apr. 1982; sponsored by the Vibration Inst.
(NASA-TM-82786; E-1121) Avail: NTIS HC A02/MF A01 CSCL 11A

Seals can exert large forces on rotors. As an example, in turbopump ring seals film stiffness as high as 90 MN/m (500,000 lb/in) have been calculated. This stiffness is comparable to the stiffness of rotor support bearings; thus seals can play an important part in supporting and stabilizing rotor systems. The work done to determine forces generated in ring seals is reviewed. Working formulas are presented for seal stiffness and damping, and geometries to maximize stiffness are discussed. An example is described where a change in seal design stabilized a previously unstable rotor. Author

EFFECTS OF ARTIFICIALLY PRODUCED DEFECTS ON FILM THICKNESS DISTRIBUTION IN SLIDING EHD POINT CONTACTS

C. Cusano (Illinois Univ. at Urbana-Champaign) and L. D. Wedeven 1981 31 p refs Presented at the Joint Lubrication Conf., New Orleans, 5-7 Oct. 1981; sponsored by the Am. Soc. of Lubrication Engr. and ASME

(NASA-TM-82732; E-1042) Avail: NTIS HC A03/MF A01 CSCL 20K

The effects of artificially produced dents and grooves on the elastohydrodynamic (EHD) film thickness profile in a sliding point contact were investigated by means of optical interferometry. The defects formed on the surface of a highly polished ball, were held stationary at various locations within and in the vicinity of the contact region while the disk was rotating. It is shown that the defects, having a geometry similar to what can be expected in practice, can dramatically change the film thickness which exists when no defects are present in or near the contact. This change in film thickness is mainly a function of the position of the defects in the inlet region, the geometry of the defects, the orientation of the defects in the case of grooves, and the depth of the defect relative to the central film thickness. BASIC LUBRICATION EQUATIONS

Bernard J. Hamrock and Duncan Dowson (Leeds Univ.) Dec. 1981 87 p refs Repr. from Ball Bearing Lubrication, chapter 5, Sep. 1981

(NASA-TM-81693; E-209) Avail: NTIS HC A05/MF A01 CSCL 11H

Lubricants, usually Newtonian fluids, are assumed to experience laminar flow. The basic equations used to describe the flow are the Navier-Stokes equation of motion. The study of hydrodynamic lubrication is, from a mathematical standpoint, the application of a reduced form of these Navier-Stokes equations in association with the continuity equation. The Reynolds equation can also be derived from first principles, provided of course that the same basic assumptions are adopted in each case. Both methods are used in deriving the Reynolds equation, and the assumptions inherent in reducing the Navier-Stokes equations are specified. Because the Reynolds equation contains viscosity and density terms and these properties depend on temperature and pressure, it is often necessary to couple the Reynolds with energy equation. The lubricant properties and the energy equation are presented. Film thickness, a parameter of the Reynolds equation, is a function of the elastic behavior of the bearing surface. The governing elasticity equation is therefore presented. A.R.H.

HIGH-CURRENT RESISTANCE WELDING OF NUCLEAR-WASTE CONTAINERS

B. J. Eberhard and J. W. Kelker, Jr. Jul. 1981 19 p ref Presented at the 62nd Am. Welding Soc. Conf., Cleveland, 6-10 Apr. 1981

(Contract DE-AC09-76SR-00001)

(DE81-030403; DPSPU-80-30-9; CONF-810404-2) Avail: NTIS HC A02/MF A01

Upset welding was selected as the process best suited for sealing the fill hole in stainless steel canisters for high level nuclear wastes since this process is amenable to use in a remotely operated facility. Welding parameters are readily controlled and dynamically recorded during the course of the weld. Weld quality can be controlled and assessed through control of the process. The process was shown to be suitable for producing welds up to 5 in. in diameter and having 0.38-in. throat thickness. Weld current of 230,000 A AC, electrode force of 75,000 lb, and weld time of 2.0 seconds were required for a 5-in. diameter weld. The welds have a wrought structure and the tensile strength of the weld metal equals or exceeds that of the annealed base material. The size weld that can be produced appears limited only by the ability to provide sufficient welding current. A welder designed to deliver 400,000 A DC is being installed in a nonradioactive nuclear waste pilot facility. DOE

(PB81-235938; SDL-81-2175-01F; NSF/DMR-81002) Avail: NTIS HC A04/MF A01 CSCL 14B

The use of measurable quantities to form images of near surface defects in ceramic and super alloy materials was examined. Ultrasound, the Rayleigh critical angle, is used as a sensitive indicator of near surface conditions. The behavior of reflected sound at this angle is influenced by material parameters such as grain size, hardness, surface residual stress, and material variation. Amplitude and phase of the reflected wave, frequency of least reflection, and the critical angle itself were used as measurable quantities. The combination of these measurables, determines separately grain size, surface stress, and material defects in the near surface region of the material. GRA

Marvin H. Hirschberg Dec. 1981 24 p refs
(NASA-TM-82745; E-1058) Avail: NTIS HC A02/MF A01 CSCL 20K

The major technology areas needed to perform a life prediction of an aircraft turbine engine hot section component are discussed and the steps required for life prediction are outlined. These include the determination of the operating environment, the calculation of the thermal and mechanical loading of the component, the cyclic stress-strain and creep behavior of the material required for structural analysis, and the structural analysis to determine the local stress-strain-temperature-time response of the material at the critical location in the components. From a knowledge of the fatigue, creep, and failure resistance of the material, a prediction of the life of the component is made. Material characterization and evaluation conducted for the purpose of calculating fatigue crack initiation lives of components operating at elevated temperatures are emphasized. J.D.H.

ANALYSIS OF STRAIN DISTRIBUTION FOR FIBER REINFORCED COMPOSITES BY MOIRE METHOD
Shinichi Koshide Aug. 1981 21 p refs In JAPANESE; ENGLISH summary
(NAL-TR-681; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

Analysis by the moire method of strain distribution on a plane of fiber reinforced composites with high rigidity was made. The strain distribution can be determined from moire fringe patterns and an electrical resistance strain gage, or fringe patterns which are obtained by a testing procedure using combined specimens. The fringe patterns are obtained by a fringe reconstructor which is an optical spatial filtering system with coherent light. The method was applied to analysis of strain distribution in strips of aluminum alloy and epoxy resin, with a circular notch, under tension. A comparison of the results with values of theoretical analysis confirms that the method is applicable to the determination of strain distribution on a plane of rigid structural materials, such as composites with circular or semi-circular notches. The influences of the notch on the mechanical properties of material under tension for each of the above composites is discussed. M.D.K.

STRENGTH AND STIFFNESS OF SMALL GLUED-LAMINATED BEAMS WITH DIFFERENT QUALITIES OF TENSION LAMINATIONS
Catherine M. Marx and Russell C. Moody May 1981 50 p refs
(AD-A106562; FSRP-FPL-381) Avail: NTIS HC A03/MF A01 CSCL 11/9

The objective of this research study was twofold: (1) to determine at what beam depth specially graded 302-24 (2) tension laminations are required to attain a 2,400 lb/sq. in. design stress; (2) to determine the appropriate design stress for specification type beams with the regular laminating grades of L1 Douglas Fir-Larch (DF-L) or No. 1D Southern Pine (SP) as the tension laminations. The 302-24 grade of lumber required for tension laminations on 24F4 deep beams is a limited resource and is not as readily available as L1 or No. 1D lumber now used as the tension lamination on 24F shallow beams thus necessitating objective (2). The 180 glued laminated beams evaluated were of near minimum quality; each selected tension lamination had a near maximum size, strength reducing characteristics positioned in the most highly stressed region of the test beams. Author (GRA)

USE OF WEIGHT FUNCTIONS TO DETERMINE THE STRESS INTENSITY FOR A CRACKED THICK-WALLED CYLINDER
Graham Clark May 1981 21 p refs
(AD-A106270; MRL-R-814) Copyright. Avail: Issuing Activity CSCL 20/11

The use of weight functions to determine stress intensities for cracked specimens is relatively simple, and, while the initial derivation of a suitable weight function for some specimen geometries may be complex, the technique offers substantial benefits. In particular, stress intensities may be estimated for any initial stress distribution, and variations in stress intensity which result from the introduction of residual stress fields may be handled without the need to perform a full re-analysis for each case. The stress intensity at the tip of a crack which grows through a known stress field has been estimated using a weight function technique. The geometry considered is a thick-walled cylinder ($R_o/R_i = 1.8$) containing a longitudinal crack along the bore surface, and stress distributions corresponding to a variety of loading arrangements are used as examples. FAILURE LOADS FOR MODEL ADHESIVE JOINTS SUBJECTED TO TENSION, COMPRESSION OR TORSION
A. N. Gent and O. H. Yeoh 25 Oct. 1981 42 p refs
(Contract N00014-76-C-0408; NR Proj. 092-555)
(AD-A106724; TR-14) Avail: NTIS HC A03/MF A01 CSCL 11/1

A simple theoretical analysis, based upon Griffith's fracture criterion, has been developed to predict the loads required to cause adhesive failure when model joints are subjected to different types of loading, viz. Tension, compression, and torsion. Two model joints are considered: a rigid cylinder partly embedded in and bonded to an elastic cylinder (termed 'rod joint' here), and, an elastic cylinder inserted partway into, and bonded to, a rigid tube (termed 'sleeve joint' here). Both types of joint have been constructed, using vulcanized rubber cylinders bonded to aluminum rods and sleeves. Measurements have been made of the failure loads under tension, compression and torsional loading. They were found to be in satisfactory agreement with the theoretical predictions except, in some instances, for rod joints subjected to tension or torsional loading when the failure loads were as much as three times the predicted values. This discrepancy is attributed to friction between the partially-detached rubber cylinder and the embedded rod, enhanced to a major degree by the tendency of the rubber cylinder to shrink in radius on stretching or twisting. A theoretical analysis of the effect of friction is presented. It predicts increasingly large pull-out forces or torques, as the depth of embedment increases, until frictional seizure occurs. Experimentally, frictional effects were eliminated by applying an internal gas pressure to the region being detached. All of the failure loads were then found to be in satisfactory agreement with the original theory, ignoring frictional effects.

LARGE DEFORMATIONS NEAR THE TIPS OF AN INTERFACE-CRACK BETWEEN TWO NEO-HOOKEAN SHEETS
J. K. Knowles and Eli Sternberg Sep. 1981 74 p refs
(Contract N00014-75-C-0196)
(AD-A106147; TR-48) Avail: NTIS HC A04/MF A01 CSCL 20/11

This paper contains an asymptotic investigation (within the nonlinear theory of elastostatic plane stress) of the deformations and stresses near the tips of a traction-free interface-crack between two dissimilar semi-infinite Neo-Hookean sheets. The results obtained are free of oscillatory singularities of the kind predicted by the linearized theory, which would require the two deformed faces of an interface-crack to overlap in the vicinity of its tips. Instead, the crack is found to open smoothly near its ends, regardless of the specific loading at infinity. Author (GRA)

CRITICAL ANGLES AND GRAZING INCIDENCE: THE BREAKDOWN OF REGULAR SHOCK REFLECTION IN SOLIDS
Thomas W. Wright Nov. 1981 58 p refs
(DA Proj. 1L1-61102-AH-43)
(AD-A107665; ARBRL-TR-02381) Avail: NTIS HC A04/MF A01 CSCL 20/11

The regular pattern for shock reflection in a nonlinear hyperelastic solid is a centered array of shocks and simple wave fans. As the angle of incidence approaches grazing incidence or a critical angle, the reflection pattern overtakes the incident wave until finally the regular pattern can no longer be sustained. By expanding the reflection solution in powers of ampliture about the linear reflection solution, it is possible to develop a procedure to solve the reflection problem for weak but finite shocks for any material symmetry. Explicit solutions can be exhibited for isotrophic materials, including relationships between amplitude and limiting angle for various boundary conditions and incident waves. Some problems require consideration of a nonlinear boundary condition even in the first approximation. Typically, these cases lead to considerable amplification in the leading reflected wave. ALTERNATIVES TO CERAMIC BRICKS AND CERAMIC-BRICK SYSTEMS
J. Michael MacDonald 1981 10 p refs Presented at the Thermal and Chem. Storage Ann. Rev. Meeting, Washington, D.C., 14-16 Sep. 1981
(Contract W-7405-eng-26)
(DE81-032029; CONF-810940-4) Avail: NTIS HC A02/MF A01

Alternative materials for use as thermal energy storage media in electric storage furnaces were evaluated and selected. Selections were based on low cost, availability, durability, and energy storage density. The materials selected were taconite pellets, river gravel, crushed stone, and crushed (air cooled) blast furnace slag. Essential material properties and energy storage densities were established. A conceptual design for an electric storage furnace using these low cost materials was developed. The performance of this conceptual furnace was characterized by an analytical model and a computer code for the model developed. Performance and design comparisons between present day furnaces and the prototype furnace were made. A significant cost advantage for the proposed furnace over existing electric storage furnaces cannot be established. DOE

THERMAL EXPANSION OF ALKALI-GRAPHITE INTERCALATION COMPOUNDS
S. E. Hardcastle 1981 4 p refs Presented at the Intern. Conf. on Phonon Phys., Bloomington, Ind., 30 Aug. 1981
(Contract DE-AC02-76ER-01198)
(DE82-000060; DOE/ER-01198/1364; CONF-810872-3) Avail: NTIS HC A02/MF A01

The c-axis thermal expansion of several alkali-graphite intercalation compounds was measured by means of X-ray scattering between 15 and 300 K. The thermal expansion depends strongly on the stage of the compound and is largest for C8M (M = K, Rb, Cs) compounds. The data are analyzed in terms of an one-dimensional quasi-harmonic approximation, which yields Gruneisen parameters two or three times as large as for pristine graphite. DOE

STRESSED KEVLAR STRAND TEST
H. Golopol, J. Clarkson, R. Moore, and N. Hetherington 10 Sep. 1981 16 p refs Presented at the JOWOG 12/25 Conf., Aldermaston, England, 21-25 Sep. 1981; sponsored by AWRE
(Contract W-7405-eng-48)
(DE81-030769; UCRL-86034; CONF-810953-3) Avail: NTIS HC A02/MF A01

The effect of time, temperature, and chemical environment on the strength retention of stressed Kevlar strands were determined. A stess load of 20% of the ultimate tensile strength was applied. Strands were hung with a suitable weight in a closed container. Each container was then provided with its own heater and chemical environment. No significant loss of strength retention was found on these stressed strands. DOE

STATIC STRESS-INTENSITY FACTORS AND DYNAMIC CRACK PROPAGATION IN PIPES Annual Report, Sep. 1981
A. F. Emery, A. S. Kobayashi, and W. J. Love Sep. 1981 206 p refs Sponsored in part by EPRI
(EPRI Proj. 231-1)
(DE82-900365; EPRI-NP-2024) Avail: NTIS HC A10/MF A01

Predictive models for critical flaw sizes, initiation crack propagation of dynamic cracks in pipes, and behavior of dynamic crack propagation in compact specimens are described. Parametric results are reported that may be used to predict critical flaw sizes for the initiation of a running crack as well as the crack propagation rate under fatigue in precracked pressurized and thermally shocked cylinders and nozzle-cylinder intersections. Fundamental properties governing rapid crack propagation and crack arrest are described, as are studies on the initiation and propagation of circumferential through cracks in pipes subjected to axial tension. Included are discussions of the use (1) the three dimensional finite element code, SAP IV, to analyze the dynamic fracture response of preexisting axially oriented through cracks at the centers of a local bulge in pressurized pipe and (2) the thermal hydraulic code LEAKER to predict the nondimensionalized depressurization rates measured in a series of dynamic pipe-rupture experiments. INVESTIGATION OF REINFORCED BRICK MASONRY BUILDINGS UNDAMAGED BY THE SAN FERNANDO EARTHQUAKE
S. A. Adham May 1981 188 p refs
(Grant NSF PFR-79-00013)
(PB82-104217; NSF/CEE-81014) Avail: NTIS HC A09/MF A01 CSCL 13M

Behavior of the buildings of the Sepulveda Veterans Administration Hospital during the 1971 San Fernando earthquake was examined. The study explored why these buildings sustained minimal structural damage while other buildings in close proximity sustained major damage. A literature review was conducted and seismic input motions at the site during the earthquake were estimated. Verifications of seismic analysis techniques using a two dimensional finite element model were determined through studies of observed earthquake damage to a six-story building. Relative displacements were calculated at the expansion joints and compared to damage of the flexible joints. Also verified were seismic analysis techniques through a study of observed earthquake damage to the boiler house building. The calibrated motions were used as input to a three dimensional model of a reinforced brick masonry building. GRA

EVALUATION OF THE FRACTURE BEHAVIOR OF CONCRETE WITH THE J-INTEGRAL
Robert C. Andren, Thomas J. Powell, Frederick V. Lawrence, and Clyde Kesler Apr. 1981 150 p refs
(Grant NSF ENG-78-07742)
(PB81-235855; NSF/ECS-81003) Avail: NTIS HC A07/MF A01 CSCL 13C

The application of the J-integral concept to concrete fracture mechanics was investigated. The J-integral is path independent line integral that is a measure of the elasto plastic stresss strain field near a crack tip. Factors were evaluated to ascertain which ones significantly affect the performance of the J-integral as a one parameter measure of fracture toughness. The critical value of the J-integal (JC) was compared with other fracture toughness parameters. GRA

EXPERIMENTS ON CONTINUOUS COMPOSITE BEAMS
P. Ansourian Mar. 1981 61 p refs
(PB81-247116; R-384) Avail: NTIS HC A04/MF A01 CSCL 20K

Six continuous composite beams of 9 m length and with compact steel section were tested. Two had limited rotation capacity and were tested under severe sagging rotation conditions; the other four were loaded symmetrically. The vertical shear resistance of the slab at interior supports assessed. It is concluded that simple plastic design incorporating full plastic moment values may be used in continuous composite beams were compact steel section, adequate slab and shear connection, even under conditions of severe rotation requirement. BOLTED CONNECTIONS IN COMPOSITE STRUCTURES
P. Ansourian and Tokuzo Sase Jan. 1981 42 p refs
(PB81-247124; R-382) Avail: NTIS HC A03/MF A01 CSCL 20K

The behavior of composite connection specimens consisting of studded T-beams in negative bending and encased I-section columns bent about the major axis is examined. Both interior and exterior column connections are tested, with the joint between the major steel components effected with simple bolted joints. At interior columns, the ultimate behavior is almost indistinguishable from that of connections with welded joints, and the full plastic moment of the beam including all the reinforcement is exceeded. At external columns, the strength and stiffness are greatly enhanced by the slab and the concrete casing, but the plastic moment of the beam is not transmitted before brittle collapse of the slab. WETLAND MAPPING FROM DIGITIZED AERIAL PHOTOGRAPHY

F. L. Scarpace, B. K. Quirk, R. W. Kiefer, and S. L. Wynn, Principal Investigators [1982] 31 p refs Original contains color imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198 ERTS
(E82-10019; NASA-CR-164816) Avail: NTIS HC A03/MF A01 CSCL 08B

Aerial photographic imagery of the Sheboygan Marsh in Wisconsin was scanned through three different narrow band interference filters centered at 45, 55, and 65 micrometers. The output data was transformed into log exposures and corrected for lens fall-off. The scanned area was approximately 253 hectares, with each pixel representing an area of 6.0 meters square on the ground. Training sets were extracted from the digital file of the imagery using the map generated from the photointerpretation and computer generated character displays from the digital file as first approximations. From these training sets, statistics were generated to be used with an elliptical classifier. The classifier generated a digital file from which color coded thematic representations of the classifications could be produced. A two stage table-look-up elliptical algorithm was used as the classification procedure. The wetland boundary was easily delineated, but there was difficulty in mapping the boundaries of vegetation within the wetland. A.R.H.

MULTIDISCIPLINARY RESEARCH ON THE APPLICATION OF REMOTE SENSING TO WATER RESOURCES PROBLEMS Progress Report, Aug. 1979 - Jul. 1980

Ralph W. Kiefer, Principal Investigator Jul. 1980 45 p ERTS
(Grant NGL-50-002-127)
(E82-10021; NASA-CR-164815) Avail: NTIS HC A03/MF A01 CSCL 08H

Progress is reported in the following NASA-funded projects: (1) sediment plume study; (2) atmospheric correction to LANDSAT imagery; (3) demonstrating and evaluating opportunites for operational application of LANDSAT data in Wisconsin; and (4) the development of a facility to process imagery for the study of land cover, land use, water quality, electrophoresis gel analysis, prediction of storm and snow flow conditions, physical oceanography, and soils. Associated projects summarized are concerned with vegetation mapping in Sheboygan Marsh, surveying the Green Bay watershed to estimate the impact of land development on bay water quality; thermal scanning of ocean fronts; lake water quality, the Irondequoit River watershed, a model of thermal environment for land use planning, and changes in wetland vegetation near the Columbia Generating Station. Emphasis was focused on the selection of equipment for the efficient processing of images used for water-quality analysis and the development of supporting software for application by users. A.R.H.

REPORT ON A SHORT COURSE IN REMOTE SENSING AND THE GEOLOGICAL APPLICATIONS OF LANDSAT MSS IMAGERY AT INPE

Nelson deJesusParada, Principal Investigator and Kampta Persaud (Geological Survey Dept. (Guyana)) Oct. 1980 48 p refs Sponsored by NASA ERTS
(E82-10024; NASA-CR-164813; INPE-1923-RPE/249) Avail: NTIS HC A03/MF A01 CSCL 05B

Training in the theory of remote sensing in Brazil involves studying the principles of electromagnetic radiation and the instrumentation used to measure the radiation characteristics of a body. The overall LANDSAT system is considered with emphasis on the multispectral band scanner and Brazil's participation in the LANDSAT Program. Geologic information from MSS imagery is at a regional scale, and three basic types are available: rock and soil, geologic structures, and landforms. Discrimination between alluvium and sedimentary or crystalline bedrock, and between units in thick sedimentary sequences is best, primarily because of topographic expressions and vegetation differences. Discrimination between crystalline rock types is poor. Folds and fractures are the best displayed geologic features and are recognizable by topographic expressions, drainage patterns, and rock or vegetational tonal patterns. Landforms are easily discriminated by their familiar shapes and patterns. The IMAGE-100 computer has the ability to extract thematic information and to enhance the image. A.R.H.

REMOTE SENSING DATA APPLIED TO LAND-USE SURVEY AT THE PARAIBA VALLEY

Nelson deJesusParada, Principal Investigator, Magda Adelaide Lombardo, Evlyn Marcia Leao DeMoraesNovo, Madalena Niero, and Celina Foresti May 1981 10 p refs Presented at the 7th Intern. Symp. on Machine Process. of Remotely Sensed Data, West Lafayette, Ind., 23-26 Jun. 1981 Sponsored by NASA ERTS
(E82-10025; NASA-CR-164812; INPE-2081-RPE/315) Avail: NTIS HC A02/MF A01 CSCL 08B

The Paraiba Valley (state of Sao Paulo) was selected as the test site in a study to develop a methodology for land-use survey and to determine the land-use modification rates using data of LANDSAT system. Both visual and automatic interpretation methods were employed to analyze seven land-use classes. They are: urban area, industrial area, bare soil, cultivated area, pastureland, reforestation and natural vegetation. By means of visual interpretation little spectral differences among those classes were observed. The automatic classification of LANDSAT MSS data using maximum likelihood algorithm shows a 39% average error of omission and a 3.4% error of commission for the seven classes. The classification results were under the influences of the complexity of land-uses in the study area, the large spectral variations of analyzed classes and the low resolution of LANDSAT data. BRAZILIAN REMOTE SENSIMG ACTIVITIES, CURRENT AND PROSPECTIVE NEEDS

Nelson deJesusParada, Principal Investigator Apr. 1981 55 p Presented at the United Nations Regional Seminar on Remote Sensing Appl. and Satellite Commun. for Education and Develop., Toulouse, 21-25 Apr. 1981 Sponsored by NASA ERTS
(E82-10026; NASA-CR-164811) Avail: NTIS HC A04/MF A01 CSCL 05A

Remote sensing activities began in Brazil in 1968 and are now concentrated in a satellite and a side-looking radar program. The radar program systematically surveys the natural resources of the whole national territory in a level of detail compatible with a 1:1,000,000 scale, focusing on geology, geomorphology, soil, agricultural aptitude, ecology, and potential land use. The satellite program receives, processes, and disseminates remotely sensed data (basically LANDSAT data) and develops methodologies for applying these data for surveying, monitoring and mapping. Special emphasis is given to national priorities, particularly food and energy. Major results obtained and difficulties encountered in the following applications are described: crop forecasting, reforestation, mineral exploration, fishing chart models, land use, sedimentation in reservoirs, and deforestation in the Amazon forest. A decision was made to upgrade existing LANDSAT reception and processing stations to receive and process MSS and thematic data from LANDSAT-D and from SPOT and to construct two satellites for launch in 1987-1990. INTEGRATION OF LANDSAT WITH GEOLOGY AND AIRBORNE GEOPHYSICS INTO AN OPERATIONAL MINERAL EXPLORATION SYSTEM Final Report, Jun. 1978 - Dec. 1980

R. J. P. Lyon and M. F. Crawford, Principal Investigators Mar. 1981 270 p refs Prepared for JPL, Pasadena, Calif. Original contains imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198 ERTS
(Contract JPL-955047)
(E82-10028; NASA-CR-164433) Avail: NTIS HC A12/MF A01 CSCL 08G

Digital data, gamma-ray spectrometry and aeromagnetic data were digitally combined and analyzed for the Bearlodge area (northeastern Wyoming) where potential resources of thorium and rare earths occur. The combined LANDSAT-geophysical data set revealed several geologic structures that were not evident in a single data set for the study area. Both qualitative and quantitative methods of analysis were performed on the combined data sets. Qualitative analysis of the data was done on a computer controlled, interactive color TV display system by overlaying the various data sets in different colors. In the Bearlodge area, this analysis revealed a pair of northwest-southeast tranding lineaments in the LANDSAT image which appeared to truncate a zone of high radioactivity. An elliptical feature formed by drainages is found. An intense thorium-gamma ray anomaly which coincides with thorium-rare earth mineralization, occurs inside this elliptical feature. T.M.

THE APPLICATION OF REMOTE SENSING TO RESOURCE MANAGEMENT AND ENVIRONMENTAL QUALITY PROGRAMS IN KANSAS Annual Report, 1 Apr. 1980 - 31 Mar. 1981

B. G. Barr and E. A. Martinko, Principal Investigators Jul. 1981 164 p ERTS
(Grant NGL-17-004-024)
(E82-10029; NASA-CR-164756) Avail: NTIS HC A08/MF A01 CSCL 05A

Cooperative demonstration projects involved three principal areas of effort: agricultural and rural development; wildlife habitat and environmental quality; urban and regional planning. Several projects are reported including: an analysis of rangeland conditions in the Cimarron National Grasslands; an inventory of land use and land cover, particularly concerning forested lands, in two Indian reservations in northeast Kansas; an identification of homogeneous revenue regions in the state; an applied agricultural research and development project for Farmland Industries, Inc.; and an analysis of crop phenology and crop patterns in the high plains for identifying optimal dates of LANDSAT data for identifying irrigated lands. Several long-term projects include: weed pest surveys; irrigated lands data compilation from LANDSAT; and the development of an inventory of abandoned mined lands and potential hazard assessment in Kansas. T.M.

DOCUMENTATION OF COMPUTER PROCEDURES FOR LABELING SPRING GRAINS AND DISCRIMINATING BETWEEN SPRING WHEAT AND BARLEY USING LANDSAT DATA

Robert Horvath, Principal Investigator, J. A. Finkler, and E. P. Crist Jul. 1981 81 p Sponsored by NASA, USDA, Dept. of Commerce, Dept. of the Interior, and Agency for International Development ERTS
(Contract NAS9-15476; Proj. AgRISTARS)
(E82-10030; NASA-CR-161081; SR-EI-04131; ERIM-152400-5-T) Avail: NTIS HC A05/MF A01 CSCL 02C

The computer software necessary to perform two research labeling procedures is described and documented. The first labeling technique identifies spring small grain fields based on similarity of growing season and temporal spectral patterns of development in LANDSAT data. The second technique further labels these fields as either wheat, barley or unknown spring grain, based on their spectral position in Tasseled Cap Greenness-Brightness space for a given day around the dough stage of wheat. The subroutines which carry out the steps of the procedure are coded in PREFOR, a preprocessed FORTRAN. The subroutines were designed to fit into the U.S. Corn/Soybeam baseline procedure software developed for use in the AgRISTARS Program. Documentation of the subroutines are provided in an appendix. OIL SHALE 1982: A TECHNOLOGY AND POLICY PRIMER
Nov. 1981 92 p refs Prepared in cooperation with Colorado School of Mines, Golden
Avail: NTIS HC A05/MF A01

An updated policy primer and technology assessment of the oil shale industry is presented for the benefit of policy makers and the general public. Methods for the development, management, and use of energy are discussed. The biological, economic, social, and political impacts and controversies surrounding current and future energy related activities are considered. Mining methods, retort processing, and methods for disposing of the shale are also discussed. M.D.K.

SIMPLIFIED ALGORITHM FOR CALCULATING RADIATIVE TRANSFER IN SATELLITE IMAGES [ALGORITMO SIMPLIFICADO PARA CALCULO DE TRANSFERENCIA RADIATIVA EM IMAGENS DE SATELITE]
L. A. V. Dias, A. E. C. Pereira, and G. Camara Jul. 1981 17 p refs In PORTUGUESE; ENGLISH abstract Presented at the 33rd Reuniao Anual da SBPC, 8-15 Jul. 1981, Salvador, Brazil
(INPE-2169-RPE/385) Avail: NTIS HC A02/MF A01

Temporal variations of Earth's atmosphere may cause problems on remote sensing data analysis of satellites, such as LANDSAT, SKYLAB and NIMBUS-7. The apparent radiance of surface features which an orbiting spacecraft measures differs from the intrinsic surface radiance of the object, due to the presence of the intervening atmosphere of Earth. An algorithm for atmospheric correction is presented. J.D.H.

RELATIONSHIPS BETWEEN SOIL MOISTURE-HOLDING PROPERTIES AND SOIL TEXTURE, ORGANIC MATTER CONTENT, AND BULK DENSITY
Hugh C. F. Riley Aug. 1981 26 p refs Transl. into ENGLISH of Rept. no. 49 Kise Agricultural Research Station, Hedmark, Norway, 13 Mar. 1979 p 379-398 Transl. by SCITRAN, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-76674) Avail: NTIS HC A03/MF A01 CSCL 08M

Specimens from the surface horizon and the subsoil of 62 soil horizons in Hedmark and Oppland were investigated to study how the mechanical composition of the soil, the organic matter content and the bulk density affect their porosity and air capacity and their total and available water content. Most of the specimens belonged to the loam group, and a smaller number was from sandy and silty types of soil. Equations were established to make it possible to calculate the water retention curves and the amount of available water from the above mentioned parameters. As a rule, errors derived from the equations are no greater than those which are found in similar research in other countries. Author

UNDERGROUND COAL MINING SECTION DATA Final Report
Charles P. Gabrill and Jack T. Urie 24 Sep. 1981 151 p refs Prepared for JPL
(NASA-CR-168393; JPL-9950-601) Avail: NTIS HC A08/MF A01 CSCL 08I

A set of tables which display the allocation of time for ten personnel and eight pieces of underground coal mining equipment to ten function categories is provided. Data from 125 full shift time studies contained in the KETRON database was utilized as the primary source data. The KETRON activity and delay codes were mapped onto JPL equipment, personnel and function categories. Computer processing was then performed to aggregate the shift level data and generate the matrices. Additional, documented time study data were analyzed and used to supplement the KETRON databased. The source data including the number of shifts are described. Specific parameters of the mines from which there data were extracted are presented. The result of the data processing including the required JPL matrices is presented. A brief comparison with a time study analysis of continuous mining systems is presented. The procedures used for processing the source data are described. N.W.

THERMAL VEGETATION CANOPY MODEL STUDIES Final Report, 1 Oct. 1978 - 1 Feb. 1980
James A. Smith, K. Jon Ranson, Duong Nguyen, and Lewis E. Link (Army Engineer Waterways Experiment Station, Vicksburg, Miss.) Aug. 1981 221 p refs
(Contract DACW39-77-C-0073; DA Proj. 4A7-62730-AT-42)
(AD-A106422; WES/TR/EL-81-6) Avail: NTIS HC A10/MF A01 CSCL 17/5

This is the final report in a series. Overall objectives of this project are concerned with developing comprehensive optical and thermal signature data bases, the development and evaluation of optical and thermal canopy radiation models, and the interpretation of these measurements. Previous technical reports in this series have described optical and thermal measurements obtained over a coniferous site (Pinus contorta) in Leadville, Colorado. This earlier data set served as a test bed for the development and initial evaluation of first, individual components, that is, needle and leaves, thermal models, and then a composite canopy terrain model. A MODEL FOR SOLVING MULTIPERIOD MULTIRESERVOIR WATER RESOURCES PROBLEMS WITH STOCHASTIC INFLOWS Ph.D. Thesis - Texas Univ. at Austin
Douglas Dewitt Cochard May 1981 282 p refs
(AD-A106769; AFIT-CI-81-48D) Copyright. Avail: Issuing Activity CSCL 13/2

The model developed solves the multiperiod multireservoir water resources problem with stochastic inflows. Of unique importance is the development of a generalized network model which solves nonlinear nonseparable quadratic problems. Quadratic functions are used to measure the future value of water to the system. The nonseparable form stems from the realization that interaction exists between the benefits to be gained from a multireservoir system. Historically this interactive nature has been ignored due to the computational difficulty of measuring and solving such relationships. Also developed is a stochastic dynamic programming approach which utilizes the results to the network optimization as data for a least squares regression analysis. A quadratic function is fit to this data and is used to represent the future value of water to the system for the next period in the dynamic programming approach. This

functional representation of the future value of water replaces the standard discrete matrix representation of dynamic programming and greatly reduces the dimensionality problems associated with the dynamic programming approach. In the end, this work represents a rare combination of generalized-nonlinear network flow programming, stochastic dynamic programming and regression analysis.

THE DEFENSE MAPPING AGENCY'S PILOT DIGITAL OPERATIONS

Bruce K. Opitz, Jerry Becker, and Henry Cook Nov. 1981 20 p
(AD-A108092) Avail: NTIS HC 02/MF A01 CSCL 08/5

The Pilot Digital Operations (PDO) project is an investigation by the Defense Mapping Agency (DMA) into the practicality and utility of computer mapping. PDO is a set of experiments whose results will be used to help in the evaluation of the feasibility and desirability of performing the MC&G production operations in the digital domain. The importance of this effort is based on the nature of future mapping sources, the desire to automate, as much as possible, the production operations and the basic trends of forthcoming technology. The experiments are meant to test available off the shelf technology. By assessing the current state of the art, DMA can determine what areas require further R&D and what are the risks associated with a digital production system. The early experiments test some basic classes of image processing algorithms. The next set test MC&G production functions. This leads to an experiment which involves actually generating a DMA product. Other experiments deal with general design issues emphasizing the human factors and data base aspects of the problems. PDO is scheduled to be completed by the end of 1982. The results to date are discussed and a brief description of the remaining experiments is given.

CARBON DIOXIDE POWER PLANT FOR TOTAL EMISSION CONTROL AND ENHANCED OIL RECOVERY

Frederick L. Horn and Meyer Steinberg Aug. 1981 28 p refs
(Contract DE-AC02-76CH-00016)
(DE81-030734; BNL-30046) Avail: NTIS HC A03/MF A01

The design of a compact environmentally acceptable carbon dioxide diluted coal-oxygen fired power plant is described. The plant releases no combustion products to the atmosphere. The oxygen for combustion is separated in an air liquefaction plant and the effluent nitrogen is available for use in oil well production. Recycle carbon dioxide mixed with oxygen replaces the nitrogen for the combustion of coal in the burners. The carbon dioxide produced is used in enhanced oil recovery operations and injected into spent wells and excavated salt cavities for long-term storage. The recovery of CO2 from a coal-burning power plant by this method appears to have the lowest energy expenditure and the lowest by-product cost compared to alternative removal and recovery processes.

NOCTURNAL DRAINAGE FLOW OVER COMPLEX TERRAIN USING A GENERALIZED SHALLOW-FLUID APPROXIMATION

B. E. Freeman, S. S. Bunker, and C. G. Davis 1981 5 p refs Presented at the AMS Conf. on Mountain Meteorology, Steamboat Springs, Colo., 10 Nov. 1981
(Contract W-7405-eng-36)
(DE81-028693; LA-UR-81-2087; CONF-811104-7) Avail: NTIS HC A02/MF A01

An approximate formulation of the problem of nocturnal drainage flow was incorporated into a computer code. This formulation representing a generalization of the shallow fluid approximation, is applicable to complex terrain and accounts for many of the salient physical effects exhibited by drainage flow. These include the dynamics of the katabatic flow, radiation cooling, surface drag, entrainment of the overlying layer, the Coriolis force and interaction with the synoptic flow. Example calculations were performed in one and two horizontal dimensions. These calculations exhibit a number of interesting qualitative flow features which have been observed, such as thinning of the layer over ridges and pooling in valleys. Hydraulic jumps in the flow are discussed. The calculation shows qualitatively correct behavior at modest computational cost. Several processes which are represented parametrically can probably be tuned by comparison with data.

PRELIMINARY RESOURCE ASSESSMENT OF COALBED METHANE IN THE UNITED STATES

Apr. 1981 30 p refs
(DE82-001356; DOE/METC/SP-186) Avail: NTIS HC A03/MF A01

Preliminary results of the DOE Methane Recovery from Coalbeds Project reveal that many of the coal regions in the United States have significant volumes of coalbed methane. These results show that 45 cooperative wells drilled to date have helped to update the estimates of methane in the various coal regions. The most promising coal region is in the Green River Basin where preliminary estimates show that the methane potential may be over 23 trillion cubic feet. Another area of considerable interest is in the Arkoma Basin where the methane content of coal samples ranged from 200 to 400 cubic feet per ton (cf/ton) of coal. The methane estimate in this basin is between 1.6 to 3.6 trillion cubic feet. The Piceance Creek coal region is an area presently generating considerable interest and industry activity. The methane content of the coal samples extracted from this basin averaged over 100 cf/ton. The Northern Appalachian region also shows considerable promise. DOE

ENVIRONMENTAL IMPACTS ASSOCIATED WITH USING PEAT FOR ENERGY

R. M. Reed, L. D. Voorhees, and P. J. Mulholland 1981 12 p refs Presented at the Intern. Gas Res. Conf., Los Angeles, 28 Sep. 1981
(Contract W-7405-eng-26)
(DE81-032000; CONF-810909-8; Publ-1795) Avail: NTIS HC A02/MF A01

It is found that the major environmental constraints associated with development of peatlands are related to disruption of important regional wetland ecosystems in terms of ground and surface water hydrology, water and air quality, critical habitats for species of limited distribution, and unique ecosystems that have important scientific and educational values. Development of peat resources for energy can be accomplished in an environmentally acceptable manner but will require detailed environmental planning and evaluation of these important regional ecosystems. EFFECTS OF POROSITY TYPE, PORE GEOMETRY, AND DIAGENETIC HISTORY ON TERTIARY RECOVERY OF PETROLEUM FROM CARBONATE RESERVOIRS Final Report, 1 Jul. 1979 - 30 Nov. 1980
G. M. Friedman, Kenneth Ruzyla, and Anne Reeckmann Sep. 1981 228 p refs
(Contract DE-AC21-79MC-11580)
(DE82-000896; DOE/MC-11580/5) Avail: NTIS HC A11/MF A01

The mechanisms controlling porosity in Red River formation (Upper Ordovician) carbonate reservoirs, were studied in order to determine what types of pore systems result from a given set of depositional and diagenetic conditions. The Red River Formation of Montana is a major oil-producing reservoir in the area and Cabin Creek Field is a good candidate to undergo tertiary recovery in the future. The stratigraphy, distribution of lithofacies, despositional environments, and diagenesis of the study area are discussed. The various types of porosity present, their origin, how they are distributed throughout the upper Red River reservoirs, and how they relate to depositional environment are discussed. Size and shape of pores and pore throats are in terms of statistical measures from capillary-pressure curves, and by interpretation of scanning-electron micrographs of resin-pore casts. Petrophysical relationships, diagenetic controls on the development and geometry of pore systems, and the role of pore geometry in the determination of carbonate reservior characteristics are also addressed. DOE

ANALYSIS OF STREAM-AQUIFER SYSTEM INTERRELATIONSHIPS IN THE BIG BLUE AND LITTLE BLUE RIVER BASINS IN GAGE AND JEFFERSON COUNTIES, NEBRASKA Final Water-resources Investigation
Michael J. Ellis Jun. 1981 56 p refs Prepared in cooperation with the Kansas-Nebraska Big Blue River Compact Administration, Lincoln, Nebr.
(PB81-245870; USGS/WRD/WRI/81-074; USGS/WRI-81-29) Avail: NTIS HC A04/MF A01 CSCL 08H

Seepage measurements made during the fall of 1978 at 21 sites in the Big Blue River basin and at 35 sites in the Little Blue River basin were used to determine stream gains or losses in 20 drainage areas in the Big Blue River basin and 31 drainage areas in the Little Blue River basin. Analyses of data from these seepage measurements and of available hydrogeologic data indicate that the most significant ground-water contributions to streamflow in the Big Blue and Little Blue River drainage basins in Gage and Jefferson Counties, NE., occur where a direct hydraulic connection exists between a stream and buried coarse-grained deposits of Quaternary age. These deposits occur in two buried bedrock valleys that trend east-northeasterly across the area. GRA

THE APRAC-3/MOBILE 1 EMISSIONS AND DIFFUSION MODELING PACKAGE: USER'S MANUAL Final Report
P. B. Simmon, R. M. Patterson, F. L. Ludwig, and L. B. Jones Jul. 1981 333 p refs
(Contract EPA-68-02-2548; SRI Proj. 8955)
(PB82-103763; EPA-909/9-81-002) Avail: NTIS HC A07/MF A01 CSCL 13B

Instructions on the use and applicability of the APRAC3/MOBILE1 emissions and diffusion model are presented in this manual. The previous version of the model, APRAC-2, completely revised the methodology of the original model, APRAC-1A. The latest version of the model remains basically the same as APRAC-2 with the exception of two important modifications. First, the emission factor computation methodology has been revised to reflect the EPA's latest update, and the portion of the code that performs those computations has been separated from the model's emission rate and diffusion modules to facilitate incorporation of future emission factor methodology updates. The second modification to the model will increase computation efficiency by automatically treating traffic links in the primary network with low vehicle miles of travel (VMT) as area sources. This will allow the remaining primary link file to fit into core storage rather than incurring the numerous and expensive input/output operations necessary when the primary traffic file is large. THE SOURCE AND TRANSPORT OF ARSENIC IN NORTHEASTERN OHIO GROUNDWATERS

Gerald Matisoff, Christopher J. Khourey, and John F. Hall 1981 75 p refs Prepared in cooperation with Case Western Reserve Univ.

(PB81-240525; W81-04658; OWRT-A-061-OHIO(1)) Avail: NTIS HC A04/MF A01 CSCL 08H

Groundwaters in the Northwest School System area of Canal Fulton, Ohio were examined for their hydrologic and chemical properties. In general, the groundwaters were interconnected by a complex system of aquifer and aquitards. Arsenic concentrations were above EPA limits in two wells, but were elevated above the background value throughout much of the area. Theoretical and laboratory studies of arsenic in these groundwaters demonstrates that it is entirely of inorganic make up, and consists of about equal parts of arsenate and arsenite. Redox considerations suggest that arsenic is controlled by an adsorption equilibrium with ferric hydroxides, and that the reduction of the ferric hydroxides by a recent lowering of Eh and/or pH in the aquifier has liberated both iron and arsenic to solution.

SMALL BUSINESS INNOVATION RESEARCH: OIL RECOVERY ENHANCEMENT BY ACOUSTIC MEANS Final Report

Ahmed S. Abou-Sayed, George J. Dvorak, Sidney J. Green, Arion H. Jones, Richard Lingle, and Joseph B. Walsh Feb. 1981 47 p refs

(Grant NSF DAR-79-17712)

(PB81-243842; NSF/IST-81001) Avail: NTIS HC A03/MF A01 CSCL 08I

The effect of a stress wave pulse on a porous saturated rock was studied. Three different situations were analyzed: The presence of a linear viscoelastic (Newtonian) fluid in the pore space; the presence of a nonlinear (non-Newtonian) fluid in the pore space without a pore filled pressure gradient, i.e., fluid flow, and the presence of a nonlinear (non-Newtonian) fluid in the pore space with a pore fluid pressure gradient, i.e., fluid flow. It was found that there can be no pumping action with a periodic stress wave in a system containing a linear, Newtonian fluid for stress pulses in the low frequency range. Pumping will occur for frequencies above about 1,000 cycles per second for the material and pore spacing considered in the study typical of some rocks.

HYDROGEOLOGIC SETTING OF THE GLACIAL LAKE AGASSIZ PEATLANDS, NORTHERN MINNESOTA

D. I. Siegel Jul. 1981 36 p refs Prepared in cooperation with Dept. of Natural Resources, St. Paul, Minn., and EPA, Washington, D.C.

(PB81-249328; USGS/WRI-81-24; USGS/WRD/WRI/81-077) Avail: NTIS HC A03/MF A01 CSCL 08H

Seven test holes drilled in the Glacial Lake Agassiz Peatlands indicate that the thickness of surficial materials along a north-south traverse parallel to Minnesota Highway 72 ranges from 163 feet near Blackduck, Minnesota to 57 feet about 3 miles south of Upper Red Lake. Lenses of sand and gravel occur immediately above bedrock on the Itasca moraine and are interbedded with lake clay and till under the peatlands. Vertical head gradients measured in a piezometer nest near Blackduck on the moraine are downward, indicative of recharge to the regional ground-water-flow system.

SOLAR HEATED FLUIDIZED BED GASIFICATION SYSTEM Patent

Shaik A. Qader, inventor (to NASA) (JPL, California Inst. of Technology Pasadena) Issued 22 Sep. 1981 5 p Filed 15 May 1980 Supersedes N80-24747 (18 - 15, p 2002) Sponsored by NASA

(NASA-Case-NPO-15071-1; US-Patent-4,290,779; US-Patent-Appl-SN-150115; US-Patent-Class-48-89; US-Patent-Class-48-99; US-Patent-Class-126-438; US-Patent-Class-250-527) Avail: US Patent and Trademark Office CSCL 10A

A solar-powered fluidized bed gasification system for gasifying carbonaceous material is presented. The system includes a solar gasifier which is heated by fluidizing gas and steam. Energy to heat the gas and steam is supplied by a high heat capacity refractory honeycomb which surrounds the fluid bed reactor zone. The high heat capacity refractory honeycomb is heated by solar energy focused on the honeycomb by solar concentrator through solar window. The fluid bed reaction zone is also heated directly and uniformly by thermal contact of the high heat capacity ceramic honeycomb with the walls of the fluidized bed reactor. Provisions are also made for recovering and recycling catalysts used in the gasification process. Back-up furnace is provided for start-up procedures and for supplying heat to the fluid bed reaction zone when adequate supplies of solar energy are not available.

INDOOR CLIMATE, OUTDOOR CLIMATE AND ENERGY CONSUMPTION: A NEW APPROACH TO THE CALCULATION OF THE EFFECT OF THE OUTDOOR AND INDOOR CLIMATE ON THE ENERGY CONSUMPTION IN BUILDINGS BASED ON METHODS OF STATISTICAL ANALYSIS

Adolph Hendricus Cornelis vanPaassen 22 Oct. 1981 131 p refs

Avail: NTIS HC A07/MF A01

The calculation efficiency of the yearly energy consumption of HVAC systems by improving the calculation method and by developing compact models of the building's thermal behavior and of the outdoor climate. Emphasis is on modeling the outdoor climate. The thermal behavior of the building is the combined effect of the solar radiation, the outdoor temperature, the energy sources and sinks within the building and the thermal behavior of the structure. It is characterized with the response factor method. With this method an excitation variable (for example the solar radiation) and the variable of interest (the indoor temperature or the cooling load) are related by a series of response factors. An experimental validation is given based on measurements of the indoor- and outdoor climate of a specific room in an excisting building. Also measurements are done on a 'climate room', which is specially designed to check these response factors. T.M.

VARIABLE GAIN FOR A WIND TURBINE PITCH CONTROL Final Report
Robert C. Seidel and Arthur G. Birchenough Dec. 1981 14 p refs
(Contract DE-AI01-76ET-20320)
(NASA-TM-82751; DOE/NASA/20320-34; E-1067) Avail: NTIS HC A02/MF A01 CSCL 10A

The gain variation is made in the software logic of the pitch angle controller. The gain level is changed depending upon the level of power error. The control uses low gain for low pitch activity the majority of the time. If the power exceeds ten percent offset above rated, the gain is increased to a higher gain to more effectively limit power. A variable gain control functioned well in tests on the Mod-0 wind turbine. T.M.

STUDY OF THE PHOTOVOLTAIC EFFECT IN THIN FILM BARIUM TITANATE Annual Report
W. W. Grannemann and Vineet S. Dharmadhikari Jan. 1982 24 p
(Grant NAG1-95)
(NASA-CR-165081; EE-273(82)NASA-931-1) Avail: NTIS HC A02/MF A01 CSCL 10A

Ferroelectric films of barium titanate were synthesized on silicon and quartz substrates, and the photoelectric effect in the structure consisting of metal deposited ferroelectric barium titanate film silicon was studied. A photovoltage with polarity that depends on the direction of the remanent polarization was observed. The deposition of BaTiO3 on silicon and fused quartz substrates was accomplished by an RF sputtering technique. A series of experiments to study the growth of ferroelectric BaTiO3 films on single crystal silicon and fused quartz substrates were conducted. The ferroelectric character in these films was found on the basis of evidence from the polarization electric field hysteresis loops, capacitance voltage and capacitance temperature techniques and from X-ray diffraction studies. S.L.

DEVELOP AND TEST FUEL CELL POWERED ON-SITE INTEGRATED TOTAL ENERGY SYSTEMS. PHASE 3: FULL-SCALE POWER PLANT DEVELOPMENT Quarterly Progress Report, Feb. - Apr. 1981
24 Jun. 1981 51 p
(Contracts DEN3-241; DE-AI01-80ET-17088)
(NASA-CR-165328; DOE/NASA/0241-1; QR-1) Avail: NTIS HC A04/MF A01 CSCL 10A

Progress toward an integrated 5kW power system based upon methanol fuel and a phosphoric acid fuel cell operating at about 473 K is described in detail. Description includes test results of advanced fuel cell catalysts, a semi-automatic acid replenishment system and a completed 5kW methanol/steam reformer. Design features of a 5kW fuel cell stack are included. The results of a preliminary system test on a reformer/stack/inverter combination are reported. An initial design for a 25 kW stack is presented. Experimental plans are outlined for data acquisition necessary for design of a 50 kW methanol/steam reformer. Activities related to complete mathematical modelling of the integrated power system, including wasteheat utilization are described. T.M.

SUMMARY AND EVALUATION OF THE CONCEPTUAL DESIGN STUDY OF A POTENTIAL EARLY COMMERCIAL MHD POWER PLANT (CSPEC) Final Report
P. J. Staiger and P. F. Penko Jan. 1982 22 p refs
(Contract DE-AI01-77ET-10769)
(NASA-TM-82734; DOE/NASA/10769-21; E-1046) Avail: NTIS HC A02/MF A01 CSCL 10B

The conceptual design study of a potential early commercial MHD power plant (CSPEC) is described and the results are summarized. Each of two contractors did a conceptual design of an approximately 1000 MWe open-cycle MHD/steam plant with oxygen enriched combustion air preheated to an intermediate temperature in a metallic heat exchanger. The contractors were close in their overall plant efficiency estimates but differed in their capital cost and cost of electricity estimates, primarily because of differences in balance-of-plant material, contingency, and operating and maintenance cost estimates. One contractor concluded that its MHD plant design compared favorably in cost of electricity with conventional coal-fired steam plants. The other contractor is making such a comparison as part of a follow-on study. Each contractor did a preliminary investigation of part-load performance and plant availability. The results of NASA studies investigating the effect of plant size and oxidizer preheat temperature on the performance of CSPEC-type MHD plants are also described. The efficiency of a 1000 MWe plant is about three points higher than of a 200 MWe plant. Preheating to 1600 F gives an efficiency about one and one-half points higher than preheating to 800 F for all plant sizes. For each plant size and preheat temperature there is an oxidizer enrichment level and MHD generator length that gives the highest plant efficiency. B.W.

TECHNOLOGY DEVELOPMENT FOR PHOSPHORIC ACID FUEL CELL POWERPLANT, PHASE 2 Final Technical Report
Larry Christner Dec. 1981 159 p refs
(Contracts DEN3-67; DE-AI03-79ET-11272)
(NASA-CR-165426; DOE/NASA/0067-79/7) Avail: NTIS HC A08/MF A01 CSCL 10A

The development of materials, cell components, and reformers for on site integrated energy systems is described. Progress includes: (1) heat-treatment of 25 sq cm, 350 sq cm and 1200 sq cm cell test hardware was accomplished. Performance of fuel cells is improved by using this material; (2) electrochemical and chemical corrosion rates of heat-treated and as-molded graphite/phenolic resin composites in phosphoric acid were determined; (3) three cell, 5 in. x 15 in. stacks operated for up to 10,000 hours and 12 in. x 17 in. five cell stacks were tested for 5,000 hours; (4) a three cell 5 in. x 15 in. stack with 0.12 mg Pt/sq cm anodes and 0.25 mg Pt/sq cm cathodes was operated for 4,500 hours; and (5) an ERC proprietary high bubble pressure matrix, MAT-1, was tested for up to 10,000 hours. DEVELOP AND TEST FUEL CELL POWERED ON-SITE INTEGRATED TOTAL ENERGY SYSTEMS. PHASE 3: FULL-SCALE POWER PLANT DEVELOPMENT Quarterly Report, May - Jul. 1981
25 Aug. 1981 35 p refs
(Contracts DEN3-241; DE-AI01-80ET-17088)
(NASA-CR-165455; DOE/NASA/0241-2; QR-2) Avail: NTIS HC A03/MF A01 CSCL 10B

A schematic and physical layout is given for the 5kW integrated system and the development status of individual components is described. The results of using a one dimensional mathematical model of the 5kW reformer are presented. Plans for a single-tube reformer test unit for the acquisition of temperature profile data are described. Tentative specifications for a 50kW dc-to-ac inverter are listed. Performance data are given on two 3-cell stacks incorporating semiautomatic acid replenishment systems and improved electrocatalysts. A qualification test on methanol/steam reforming catalyst T2107RS is reported, including a portion in which the catalyst was deliberately poisoned with 800 ppm ethanol in the feed. Author

DEMONSTRATION OF CATALYTIC COMBUSTION WITH RESIDUAL FUEL Final Report

W. J. Dodds and E. E. Ekstedt Aug. 1981 106 p refs
(Contracts DEN3-155; DE-A101-77ET-10350)
(NASA-CR-165369; DOE/NASA/0155-1; R81AEG590) Avail: NTIS HC A06/MF A01 CSCL 10B

An experimental program was conducted to demonstrate catalytic combustion of a residual fuel oil. Three catalytic reactors, including a baseline configuration and two backup configurations based on baseline test results, were operated on No. 6 fuel oil. All reactors were multielement configurations consisting of ceramic honeycomb catalyzed with palladium on stabilized alumina. Stable operation on residual oil was demonstrated with the baseline configuration at a reactor inlet temperature of about 825 K (1025 F). At low inlet temperature, operation was precluded by apparent plugging of the catalytic reactor with residual oil. Reduced plugging tendency was demonstrated in the backup reactors by increasing the size of the catalyst channels at the reactor inlet, but plugging still occurred at inlet temperature below 725 K (845 F). Operation at the original design inlet temperature of 589 K (600 F) could not be demonstrated. Combustion efficiency above 99.5% was obtained with less than 5% reactor pressure drop. Thermally formed NO sub x levels were very low (less than 0.5 g NO2/kg fuel) but nearly 100% conversion of fuel-bound nitrogen to NO sub x was observed. M.D.K.

ADVANCED GAS TURBINE (AGT) POWERTRAIN SYSTEM INITIAL DEVELOPMENT REPORT Progress Report, 20 May - 24 Sep. 1979

Aug. 1980 150 p Prepared in cooperation with AiResearch Mfg. Co., Phoenix, Ariz.
(Contract DEN3-37)
(NASA-CR-165130; DOE/NASA/0037-80/2; DDA-ADR-10086) Avail: NTIS HC A07/MF A01 CSCL 10B

The powertrain consists of a single shaft regenerated gas turbine engine utilizing ceramic hot section components, coupled to a slit differential gearbox with an available variable stator torque converter and an available Ford intergral overdrive four-speed automatic transmission. Predicted fuel economy using gasoline fuel over the combined federal driving cycle (CFDC) is 15.3 km/1, which represents a 59% improvement over the spark-ignition-powered baseline vehicle. Using DF2 fuel, CFDC mileage estimates are 17.43 km/1. Zero to 96.6 km/hr acceleration time is 11.9 seconds with a four-second accleration distance of 21.0 m. The ceramic radial turbine rotor is discussed along with the control system for the powertrain. T.M.

SILICON PRODUCTION PROCESS EVALUATIONS Quarterly Technical Progress Report, 1 Aug. - 31 Oct. 1981

Dec. 1981 18 p refs Prepared for JPL
(Contract JPL-956045)
(NASA-CR-163470; DOE/JPL-956045-81/2; JPL-9950-621; QTPR-2) Avail: NTIS HC A02/MF A01 CSCL 10A

Chemical engineering analysis of the HSC process (Hemlock Semiconductor Corporation) for producing silicon from dichlorosilane in a 1,000 MT/yr plant was continued. Progress and status for the chemical engineering analysis of the HSC process are reported for the primary process design engineering activities: base case conditions (85%), reaction chemistry (85%), process flow diagram (60%), material balance (60%), energy balance (30%), property data (30%), equipment design (20%) and major equipment list (10%). Engineering design of the initial distillation column (D-01, stripper column) in the process was initiated. The function of the distillation column is to remove volatile gases (such as hydrogen and nitrogen) which are dissolved in liquid chlorosilanes. Initial specifications and results for the distillation column design are reported including the variation of tray requirements (equilibrium stages) with reflux ratio for the distillation. T.M.

SILICON-ON CERAMIC PROCESS: SILICON SHEET GROWTH AND DEVICE DEVELOPMENT FOR THE LARGE-AREA SILICON SHEET TASK OF THE LOW-COST SOLAR ARRAY PROJECT Final Report

B. L. Grung, J. D. Heaps, F. M. Schmit, S. B. Schuldt, and J. D. Zook 3 Mar. 1981 239 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-954356)
(NASA-CR-163476; DOE/JPL-954356-80/15; JPL-9950-617) Avail: NTIS HC A11/MF A01 CSCL 10A

The technical feasibility of producing solar-cell-quality sheet silicon to meet the Department of Energy (DOE) 1986 overall price goal of $0.70/watt was investigated. With the silicon-on-ceramic (SOC) approach, a low-cost ceramic substrate is coated with large-grain polycrystalline silicon by unidirectional solidification of molten silicon. This effort was divided into several areas of investigation in order to most efficiently meet the goals of the program. These areas include: (1) dip-coating; (2) continuous coating designated SCIM-coating, and acronym for Silicon Coating by an Inverted Meniscus (SCIM); (3) material characterization; (4) cell fabrication and evaluation; and (5) theoretical analysis. Both coating approaches were successful in producing thin layers of large grain, solar-cell-quality silicon. The dip-coating approach was initially investigated and considerable effort was given to this technique. The SCIM technique was adopted because of its scale-up potential and its capability to produce more conventiently large areas of SOC. N.W.

DEVELOPMENT OF A POLYSILICON PROCESS BASED ON CHEMICAL VAPOR DEPOSITION (PHASE 1) Quarterly Progress Report, 1 Jan. - 31 Mar. 1981

J. McCormick, A. Arvidson, D. Sawyer, and F. Plahutnik Jun. 1981 51 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955533)
(NASA-CR-163475; DOE/JPL-955533-81/6; JPL-9950-618; QPR-6) Avail: NTIS HC A04/MF A01 CSCL 10A

A dichlorosilane-based reductive chemical vapor deposition (CVD) process demonstrated is capable of producing, at low cost, high quality polycrystalline silicon. Testing of decomposition reactor heat shields to insure that the shield provides adequate personnel protection assuming a worst case explosion was completed. Minor modifications to a production reactor heat shield provided adequate heat shield integrity. Construction of the redesigned PDU (Process Development Unit) to accommodate all safety related information proceeded on schedule. Structural steel work was corppleted as is the piping and instrumentation design work. Major pieces of process equipment were received and positioned in the support structure and all transfer piping and conduits to the PDU were installed. Construction was completed on a feed system for supplying DCS to an intermediate sized reactor. The feed system was successfully interfaced with a reactor equipped with a modified heat shield. Reactor checkout was completed. Author

A STUDY PERTAINING TO INERTIAL ENERGY STORAGE MACHINE DESIGNS FOR SPACE APPLICATIONS Final Report

Raymond C. Zowarka Aug. 1981 68 p refs Prepared for JPL
(Contract JPL-955969)
(NASA-CR-163465) Avail: NTIS HC A04/MF A01 CSCL 10C

The preliminary design of a counterrotating fast discharge homopolar generator (HPG) and a counterrotating active rotary flux compressor (CARFC) for space application is reported. The HPG is a counterrotating spool-type homopolar with superconducting field coil excitation. It delivers a 20-ms, 145-kJ pulse to a magnetoplasmahydrodynamic thruster. The peak output current is 42.7 kA at 240 V. After 20 ms the current is 29.7 kA at 167 V. The CARFC delivers ten 50-kJ, 250 microsecond pulses at 50-ms interval to six Xenon flash lamps pumping an Nd glass laser. The flux compressor is counterrotating for torque compensation. Current is started in the machine with a 5-kV, 5-kJ pulse-charged capacitor. Both designs were based upon demonstrated technology. The sensitivity of the designs to technology that may be available in five to ten years was determined. Author

DEVELOPMENT AND FABRICATION OF A SOLAR CELL JUNCTION PROCESSING SYSTEM
S. Bunker Oct. 1981 30 p refs Sponsored in part by DOE Prepared for JPL
(Contracts NAS7-100; JPL-955640)
(NASA-CR-163474; DOE/JPL-955640-81/7; JPL-9950-623; QR-10073-07; QR-7) Avail: NTIS HC A03/MF A01 CSCL 10A

A solar cell junction processing system was developed and fabricated. A pulsed electron beam for the four inch wafers is being assembled and tested, wafers were successfully pulsed, and solar cells fabricated. Assembly of the transport locks is completed. The transport was operated successfully but not with sufficient reproducibility. An experiment test facility to examine potential scaleup problems associated with the proposed ion implanter design was constructed and operated. Cells were implanted and found to have efficiency identical to the normal Spire implant process. S.L.

A CONCEPTUAL DESIGN STUDY OF POINT FOCUSING THIN-FILM SOLAR CONCENTRATORS Final Report
11 Nov. 1981 128 p refs Prepared for JPL
(Contract JPL-955804)
(NASA-CR-163472; JPL-9950-625) Avail: NTIS HC A07/MF A01 CSCL 10A

Candidates for reflector panel design concepts, including materials and configurations, were identified. The large list of candidates was screened and reduced to the five most promising ones. Cost and technical factors were used in making the final choices for the panel conceptual design, which was a stiffened steel skin substrate with a bonded, acrylic overcoated, aluminized polyester film reflective surface. Computer simulations were run for the concentrator optics using the selected panel design, and experimentally determined specularity and reflectivity values. Intercept factor curves and energy to the aperture curves were produced. These curves indicate that surface errors of 2 mrad (milliradians) or less would be required to capture the desired energy for a Brayton cycle 816 C case. Two test panels were fabricated to demonstrate manufacturability and optically tested for surface error. Surface errors in the range of 1.75 mrad and 2.2 mrad were measured. T.M.

EFFICIENT STRUCTURES FOR GEOSYNCHRONOUS SPACECRAFT SOLAR ARRAYS. PHASE 1, 2 AND 3 Final Report
Louis R. Adams and John M. Hedgepeth 14 Sep. 1981 102 p refs Prepared for JPL
(Contracts NAS7-100; JPL-955647)
(NASA-CR-163471; ARC-TN-1098; JPL-9950-626) Avail: NTIS HC A06/MF A01 CSCL 10A

Structural concepts for deploying and supporting lightweight solar-array blankets for geosynchronous electrical power are evaluated. It is recommended that the STACBEAM solar-array system should be the object of further study and detailed evaluation. The STACBEAM system provides high stiffness at low mass, and with the use of a low mass deployment mechanism, full structural properties can be maintained throughout deployment. The stowed volume of the STACBEAM is acceptably small, and its linear deployment characteristic allows periodic attachments to the solar-array blanket to be established in the stowed configuration and maintained during deployment. N.W.

INTERNATIONAL MARKET ASSESSMENT OF STAND-ALONE PHOTOVOLTAIC POWER SYSTEMS FOR COTTAGE INDUSTRY APPLICATIONS Final Report
Therese M. Philippi Nov. 1981 290 p refs
(Contracts DEN3-197; DE-AI01-79ET-20485)
(NASA-CR-165287; DOE/NASA/0197-1; IITRI-J06519) Avail: NTIS HC A13/MF A01 CSCL 10B

The final result of an international assessment of the market for stand-alone photovoltaic systems in cottage industry applications is reported. Nonindustrialized countries without centrally planned economies were considered. Cottage industries were defined as small rural manufacturers, employing less than 50 people, producing consumer and simple products. The data to support this analysis were obtained from secondary and expert sources in the U.S. and in-country field investigations of the Philippines and Mexico. The near-term market for photovoltaics for rural cottage industry applications appears to be limited to demonstration projects and pilot programs, based on an in-depth study of the nature of cottage industry, its role in the rural economy, the electric energy requirements of cottage industry, and a financial analysis of stand-alone photovoltaic systems as compared to their most viable competitor, diesel driven generators. Photovoltaics are shown to be a better long-term option only for very low power requirements. Some of these uses would include clay mixers, grinders, centrifuges, lathes, power saws and lighting of a workshop. Author

THE NASA LEWIS LARGE WIND TURBINE PROGRAM
R. L. Thomas and D. H. Baldwin 1981 24 p refs Presented at the 5th Biennial Wind Energy Conf. and Workshop, Washington, D.C., 5-7 Oct. 1981
(Contract DE-AI01-79ET-20305)
(NASA-TM-82761; DOE/NASA/20305-7; E-1082) Avail: NTIS HC A01/MF A01 CSCL 10B

The program is directed toward development of the technology for safe, reliable, environmentally acceptable large wind turbines that have the potential to generate a significant amount of electricity at costs competitive with conventional electric generation systems. In addition, these large wind turbines must be fully compatible with electric utility operations and interface requirements. Advances are made by gaining a better understanding of the system design drivers, improvements in the analytical design tools, verification of design methods with operating field data, and the incorporation of new technology and innovative designs. An overview of the program activities is presented and includes results from the first and second generation field machines (Mod-OA, -1, and -2), the design phase of the third generation wind turbine (Mod-5) and the advanced technology projects. Also included is the status of the Department of Interior WTS-4 machine. T.M.

HC A05/MF A01 CSCL 10/3

Further development of Ca/SOC12 was studied. The use of lithium (Li) anodes with thionyl chloride (SOC12) was investigated advancing from laboratory cells to a viable 400-600 WH/Kg system demonstrated in cell sizes up to 17000 AH. Performance improvements were made, espcially in problems such as voltage delay due to anode passivation. Response to abuse of Li/SOC12 cells primarily results from the reactivity of molten Li, a problem compounded by its low melting point of 180 C. It is assumed that most Group I and II metals are highly reactive in the molten state and the problems might be reduced by using materials with higher melting points. Several Group I and II elements have energy densities near that of Li, such as Na, Ca and Mg; of these three however, only Ca and Mg have acceptable melting points. Ca, though lower in energy density than Mg, is capable of 5.93 WH/cc, has a working voltage of approximately 3.0V, and has a higher melting point than Mg. E.A.K.

ALTERNATE THERMOCHEMICAL CYCLES

Charles M. Hollabaugh, Melvin G. Bowman, and Charles L. Peterson 1981 6 p refs Presented at Ann. Contractors' Rev. Meeting on Thermal and Chem. Storage, Tysons Corners, Va., 14-16 Sep. 1981 Submitted for publication
(DE81-030248; LA-UR-81-2513; CONF-810940-5) Avail:
NTIS HC A02/MF A01

Experimental verification of all steps in the bismuth sulfate cycle was obtained. At acid concentrations greater than 52.7 wt percent, normal Bi2(SO4)3 is formed but at lower concentrations, greater than 3.0 wt percent, the bismuth oxysulfate, BiO(SO4)2, is formed. Upon heating to temperatures in the range of 975 to 1150 K, both decompose by the loss of SO3 to a final composition of Bi2O2 3(SO4)07. The higher sulfates are regenerated by reaction of this product with H2SO4. Solids handling and decomposition were studied in a laboratory-scale rotary kiln and a dual-particle fluidized bed. Kiln experiments with Bi2O(SO4)2, ZnSO4, and Co3O4 show that in temperature range of 1125 to 1285 K, over 90 percent decomposition occurs during the 60 s residence time. A higher temperature is required for La2(SO4)3 decomposition. A dual-particle fluidized bed was constructed and tested with ZnSO4 powder.

NTIS HC A02/MF A01

Thermally activated batteries using Li(Si)/FeS2 for use in systems which require a storage life of 25 years and high reliability are examined. All of the materials in the system, both organic and inorganic are incorporated except the heat paper and electric match are studied. No compatibility or aging problems are indicated. The following results are reported: oxygen vanishes from the overgas in containers that were accelerated aged; hydrogen increases sharply in the overgas initially but generally decreases as aging progresses. No unexpected or significant changes were observed in the volume resistivity, glass transition temperature, or shear modulus or organic materials. DOE

ENERGY IN THE 1980S: A CALL FOR LEADERSHIP. THE PUBLIC AWARENESS SYMPOSIUM

Jul. 1981 79 p refs Presented at WATTec Energy Awareness Conf., Knoxville, Tenn., 18-20 Feb. 1981

(Contract W-7405-eng-26)
(DE81-027613; CONF-810250) Avail: NTIS
HC A05/MF A01

A variety of programs was offered. Issues relevant to US energy problems were addressed. The energy-related wares of 43 leading domestic and foreign industrial and commercial institutions were displayed. The public awareness symposium included business, government, religious, and educational leaders. The technical societies' presidents' program brought together 25 national presidents or their representatives to discuss mutual concerns. Finally, two $1000 engineering and communication scholarships were awarded for creating new and novel ways of providing the general public with information on complex energy-related technical matters. POTENTIAL FOR USING PARABOLIC TROUGH COLLECTORS TO SUPPLEMENT POWER CYCLE BOILERS
W. P. Schimmel, Jr. and L. L. Lukens 1981 17 p refs Presented at Winter Ann. Meeting of the ASME Technol. and Soc. Div., Washington, D.C., 15 Nov. 1981
(Contract DE-AC04-76DP-00789)
(SAND-81-0572C; CONF-811101-3) Avail: NTIS
HC A02/MF A01

The advantage of such a system is that solar energy is used to heat the water in a steam Rankine cycle device up to the superheat regime, thus displacing the fossil fuel usually required. The temperature associated with this portion of the power cycle is typically on the order of 320 C or less, which makes it compatible with current parabolic trough collector systems. A system model which lends itself to optimization studies was constructed and exercised over a range of the multiparameter space involved. The collector field, storage, supplementary fossil boiler and superheater, and turbine/generator traded off to obtain a series of economically optimal systems for various years and solar fractions. DEVELOPMENT OF A HIGH-EFFICIENCY GAS-FIRED WATER HEATER
A. D. Vasilakis, J. Gerstmann, J. F. Pearson, and D. J. Walukas (Union Carbide Corp., Oak Ridge, Tenn.) 1981 11 p refs Presented at Intern. Gas Res. Conf., Los Angeles, 28 Sep. 1981
(Contract W-7405-eng-26)
(DE81-032028; CONF-810909-6) Avail: NTIS
HC A02/MF A01

Unlike conventional water heaters which use a center-flue water storage tank, the design decouples the water heating and storage functions through the use of an external heat exchanger, thus reducing standby losses. The compact high-effectiveness heat exchanger achieves a recovery efficiency of 82 percent, using a naturally-aspirated, 100 percent premixed burner. Besides its low cost, this burner has the additional advantage of producing very low emissions of NO sub x. The use of an internally insulated polyethylene lined 40 gallon storage tank is expected to provide significantly longer service life than conventionally-lined steel tanks, thereby enhancing consumer acceptance. A description of the design of the water heater and the results of prototype efficiency and emission tests are included. Also included are data on heat exchanger and storage tank temperature distributions, standby losses, and hot water delivery capability. T.M.

RISK OF PRODUCING ENERGY, AND CONSERVING IT
H. Inhaber, G. Caton, and R. Gove 1981 25 p refs Presented at 6th Intern. Symp. on the Uranium Inst., London, Sep. 1981
(Contract W-7405-eng-26)
(DE81-030807; CONF-810965-1) Avail: NTIS
HC A02/MF A01

The idea that society can have a free lunch in the form of a risk-free energy system is rapidly fading away. All energy systems have some risk to human health, and for some it can be substantial. Nuclear power seems to have both a low occupational and public risk compared to other forms. In addition to this, research is presented with calculations on some of the risk associated with sealing up houses to keep heat in. When the effects of the accumulated radon are included, the risk per unit energy saved for this form of conservation can be great. Indeed, it appears to be much greater than the public risk of nuclear power. DOE

THERMIONIC-COMBUSTOR COMBINED-CYCLE SYSTEM. VOLUME 3: A THERMIONIC CONVERTER DESIGN FOR GAS-TURBINE COMBINED-CYCLE SYSTEMS
G. O. Fitzpatrick, E. J. Britt, and R. S. Dick, Jr. May 1981 19 p refs
(Contract DE-AC02-76ET-11293)
(DE82-000729; DOE/ET-11293/T4-Vol-3;
COO-2263-20-Vol-3; NSR-2-20-Vol-3) Avail: NTIS
HC A02/MF A01

Thermionic converter design is strongly influenced by the configuration of the heat source and heat sink. These two externally imposed conditions are of major importance in arriving at a viable converter design. In addition to these two factors, the economical and reliable transfer of energy internally within the converter is another major item in the design. The engineering trade-offs effects made in arriving at the design chosen for the gas turbine combined cycle combustor are reviewed. DOE

REDUCING CONVECTIVE LOSSES FROM COVER GLAZINGS OF SOLAR-THERMAL COLLECTORS
Pattabiraman Raghuraman and Daniel Kon 1981 8 p refs Presented at the Winter Ann. Meeting of the ASME Technol. and Soc. Div., Washington, D.C., 15-20 Nov. 1981
(Contract DE-AC02-76ET-20279)
(DE81-025726; DOE/ET-20279/146; CONF-811101-9) Avail: NTIS HC A02/MF A01

Convective heat losses from cover glazings of solar thermal collectors are reduced by forming perpendicular crisscross rectangular grooves on the glazing which cause the air flow to form recirculating zones in the grooves. Experiments on the effects of varying groove geometry show that the cover-glazing convective heat transfer coefficient can be reduced by a factor of four or better. Results of the experimental and analytical work and a description of the design considerations in optimizing the groove geometry are presented. DOE

CHOICE AND UTILIZATION OF ENERGY-USING DURABLES

Electric Power Research Inst. Aug. 1981 349 p refs Workshop held in Boston, 1-2 Nov. 1979 Sponsored by Electric Power Research Inst.
(EPRI Proj. 1050)
(DE81-904228; EPRI-EA-1961; CONF-7911154) Avail: NTIS HC A15/MF A01

The adequacy of state of the art methods to analyze the choice and utilization of energy using durables by households is assessed. The long run adjustment process of households to higher energy prices is characterized in large part by their choice of type and efficiency of new energy using durables (e.g., major appliances and automobiles). Trade-offs must be made between original purchase price and future operating costs, the latter depending not only on prospective energy costs but on expected levels of utilization. Considerable progress has been made in modeling these important factors and their interactions. DOE

ANALYSIS TO DEVELOP A PROGRAM FOR ENERGY-INTEGRATED FARM SYSTEMS

D. E. Eakin, M. A. Clark, L. K. Inaba, and K. I. Johnson Sep. 1981 127 p refs
(Contract DE-AC06-76RL-01830)
(DE82-000318; PNL-3981) Avail: NTIS HC A07/MF A01

A program to use renewable energy resources and possibly develop decentralization of energy systems for agriculture is discussed. The program's objective is determined by: (1) an analysis of the technologies that could be utilized to transform renewable farm resources to energy by the year 2000, (2) the quantity of renewable farm resources that are available, and (3) current energy-use patterns. Individual research, development, and demonstration projects are fit into a national program of energy-integrated farm systems on the basis of market need, conversion potential, technological opportunities, and acceptability. Quantification of these factors for the purpose of establishing program guidelines is conducted using the following four precepts: (1) market need is identified by current use of energy for agricultural production; (2) conversion potential is determined by the availability of renewable resources; and (3) technological opportunities are determined by the state-of-the-art methods, techniques, and processes that can convert renewable resources into farm energy. DOE

DAYLIGHTING

Sep. 1981 12 p
(DE82-000930; DOE/CE-0022) Avail: NTIS HC A02/MF A01

A catalog focusing on daylighting design and calculation methods in commercial buildings is presented. Primary sources of daylight in buildings are described briefly. Problems of appropriate design to maximize the use of daylighting; lighting controls; and operable Sun control devices are discussed. DOE

N82-16516# Oak Ridge National Lab., Tenn. Engineering Technology Div.

ASSESSMENT OF SEASONAL-EFFICIENCY MODELS FOR NATURAL-GAS-FIRED RESIDENTIAL FURNACES

N. Domingo and E. G. Keshock Sep. 1981 81 p refs
(DE82-000499; ORNL-5801) Avail: NTIS HC A05/MF A01

Several methods for determining the seasonal efficiency and operating costs of residential fossil-fuel-fired heating systems are discussed. Four computer models for determining such efficiency, the Honeywell HFLAME model, the National Bureau of Standards DEPAF model, the Institute of Gas Technology SPACE-FI model, and the Carrier Corporation model, are separately described, discussed, and evaluated in relation to their use in predicting seasonal performance of residential gas-fired heating systems. A general conclusion is that purely analytical estimations of seasonal furnace efficiencies are not generally reliable principally because of: (1) a variety of furnace designs; and (2) the different infiltration characteristics of homes. DOE

N82-16517# Foster Wheeler Corp., Livingston, N.J.

INDUSTRIAL STEAM SUPPLY SYSTEM CHARACTERISTICS PROGRAM. PHASE 2: LOW- AND MEDIUM-Btu GAS-FIRED BOILERS WITH ASSOCIATED GASIFICATION PLANTS Final Report

Sep. 1981 292 p refs Prepared for ORNL
(Contract W-7405-eng-26)
(DE82-000535; ORNL/Sub-80/13847/2; FWDC-9-41-8903) Avail: NTIS HC A13/MF A01

For each system, two coal sources were considered, an Eastern high-sulfur bituminous coal and a Western low-sulfur subbituminous coal. Eight different systems were studied and conceptual cost estimates prepared for each of them. Scaling factors were developed over a range of plant sizes; cost ratios were prepared for multiple unit systems; and cost sensitivities vs degree of sulfur removal were developd for each of the on-site gasification systems. T.M.

ASSESSMENT OF EMERGING ENERGY SOURCES Summary Report

Sep. 1981 43 p refs
(DE82-900318; EPRI-EA-2023-SY) Avail: NTIS HC A03/MF A01

The results of a broad review and analysis of the commercialization potential for eight emerging sources of energy are summarized. Tight gas sands, heavy oil, methane from geopressured aquifers, oil shale, enhanced oil recovery, advanced coal mining technologies, and underground coal gasification are discussed. Each source of energy or technology was evaluated with respect to six factors affecting commercialization: size and characteristics of resource; technical and economic performance; relevant energy market growth rates; logistical considerations; development lead times; and regulatory and institutional factors. The evaluation was based on a review of existing literature, extensive interviews with industry expert, and an overall assessment of the degree to which these factors would constrain commercial development. In addition, estimates were made of supply potential from each emerging energy. DOE

N82-16520# Oak Ridge Associated Universities, Tenn. Labor and Policy Studies Program.

SOME EMPLOYMENT AND EARNINGS IMPLICATIONS OF REGIONAL BIOMASS ENERGY UTILIZATION: NEW ENGLAND AND THE CORNBELT STATES

Wayne Stevenson, Sharon E. Bell, Larry M. Blair, Ruth M. Gove, and Joanna R. Little Aug. 1981 244 p refs
(Contract DE-AC05-76OR-00033)
(DE81-030689; ORAU-181) Avail: NTIS HC A11/MF A01

Because of their abundant forest and agricultural biomass resources, New England and the Cornbelt are likely to grow considerably in the development of biomass energy systems during the next decade or two. Forty thousand or more permanent jobs might be created in New England's wood energy industry by the end of the century. If alcohol-fuel use continues to grow, even greater potential for employment in biomass energy exists in the Cornbelt states. The associated earnings would be quite substantial for both regions. The direct combustion of wood and activities related to alcohol-fuel production are expected to be the major contributors to biomass energy production, employment, and earnings; but other biomass systems show potential as well. Energy extraction from municipal waste, anaerobic digestion of animal manure, and other biomass conversion systems will all generate employment as they grow in use. DOE

N82-16521# Exxon Research and Engineering Co., Linden, N.J. Advanced Energy Systems Labs.

DESIGN AND COST ANALYSIS OF A 20-kWh BIPOLAR ZINC-BROMINE BATTERY

Harry Einstein, Richard V. Bellows, Patrick Grimes, Edward Kantner, Paul Malachesky, and Kenneth Newby 1981 4 p refs Presented at 6th Elec. Vehicle Council Symp., Baltimore, 21 Oct. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030117; SAND-81-7147C; CONF-811010-4) Avail: NTIS HC A02/MF A01

Exxon's approach to the system uses conductive carbon plastic electrodes in a bipolar configuration, separable bromine complexes, and selective membranes in a circulating electrolyte design. The battery design consists of two kWh battery stacks placed back-to-back with a common center electrolyte feed block. Each of the two battery stacks consists of 78 cells for a system voltage of 120 volt output. Active electrode area per electrode is 12 sq dm cell-to-cell spacing is 0.25 cm. The two-stack module is assembled over a tray serving as a cover for the plastic electrolyte reservoir. Unit cells are comprised of alternating bipolar electrodes and separator assemblies. The projected battery factor price is discussed, along with the manufacturing, materials, and labor costs. T.M.

COMPRESSED AIR ENERGY STORAGE PRELIMINARY DESIGN AND SITE DEVELOPMENT PROGRAM IN AN AQUIFER. TURBOMACHINERY DESIGN Final Report

P. A. Berman, J. S. Bonk, W. F. Kobett, N. S. Kosanovich, L. J. Long, and D. J. Marinacci 31 Jul. 1981 559 p Prepared in cooperation with Westinghouse Electric Corp., Concordville, Pa. Sponsored in part by EPRI
(Contracts DE-AC02-78ET-29232; ET-78-C-01-2159; EPRI Proj. RP 1081-3)
(DE82-000672; DOE/ET-29232/T4-Vol-5-Pt-1) Avail: NTIS HC A24/MF A01

Compressed Air Energy Storage (CAES) is a means of storing electrical energy generated by utility baseload power plants during off-peak hours. This stored energy will be used during periods of high demand. Compressed Air Energy Storage (CAES) system uses off-peak power from an electrical grid to operate an electric dynamo. This is used as a motor to drive a compressor train that charges atmospheric air at elevated pressure into an underground aquifer. During high electrical demand periods, the pressurized air is withdrawn from the aquifer and channeled to combustors where it is heated and then expanded through a combustion turbine. The turbine drives the electric dynamo, being operated as a generator, to supply power back to the grid. Since the CAES turbine train is divorced from the compressor during power generation, the net output power is about three times that of a normal combustion turbine. Although the fuel consumption rate is nearly the same, the heat rate is much lower. DOE

N82-16525# Mathematical Sciences Northwest, Inc., Bellevue, Wash.

ENERGY EXCHANGER PERFORMANCE AND POWER CYCLE EVALUATION, EXPERIMENTS AND ANALYSIS Final Report, 23 May 1978 - 31 Dec. 1980

W. J. Thayer, III, Robert T. Taussig, John F. Zumdieck, Thinium S. Vaidyanathan, and Walter H. Christiansen Apr. 1981 161 p refs
(Contract DE-AC06-78ER-01084)
(DE82-001069; DOE/ER-01084/T1) Avail: NTIS HC A08/MF A01

The energy exchanger, or pressure exchanger, is a rotating, axial flow machine which utilizes unsteady gasdynamic processes to directly transfer work between two gas streams. A program which has provided technology required for the development of efficient energy exchangers for power operation applications is described. The program contains three major elements: testing of a laboratory scale device, development of an energy exchanger flow model, and analysis of potential applications in advanced power generation cycles. The test energy exchanger was developed and tested over a range of operating conditions. This device transferred approximately 100 kW of mechanical power between two gas streams by simultaneously expanding one stream and compressing the other through pressure ratios of approximately 2.5. The efficiency of this transfer process was as high as 74%. DOE

HEAT STORAGE WITH AN INCONGRUENTLY MELTING SALT HYDRATE AS STORAGE MEDIUM BASED ON THE EXTRA WATER PRINCIPLE

Simon Furbo Dec. 1980 17 p refs
(DE82-901186; DTH-LV-MEDD-108; Rept-8) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

The extra water principle, a heat of fusion storage method, is described. The extra water principle uses an inorganic, incongruently melting salt hydrate as a reliable and stable storage medium in an inexpensive way. Different heat storages using the extra water principle are described. The advantages of using a heat fusion storage unit based on Na2S2O(3).5H2O and the extra water principle instead of a traditional hot water tank in small solar heating systems for domestic hot water supply are shown. In small solar heating systems the heat fusion storage supplies all the wanted hot water in the summer during longer periods than an ordinary hot water storage. It is concluded that the heat of fusion storage is favorable in domestic hot water supply systems with an auxiliary energy source which during the summer have a large energy consumption compared with the energy demands for the hot water supply. DOE

N82-16527# Battelle Pacific Northwest Labs., Richland, Wash.
DEVELOPMENT OF A LOW-COST BLACK-LIQUID SOLAR COLLECTOR, PHASE 2 Final Report, Sep. 1979 - Jul. 1981
D. K. Landstrom, S. G. Talbert and V. D. McGinniss 30 Sep. 1981 225 p refs
(Contract DE-AC04-79CS-30171)
(DE82-000033; DOE/CS-30171/3) Avail: NTIS HC A10/MF A01

Research efforts were directed toward: evaluating the long-term durability of various plastic materials and solar collector designs; obtaining sufficient outdoor performance data to design a full-scale demonstration of a black liquid solar collector for a commercial application; working closely with a company willing to investigate the possible commercialization of a black liquid plastic collector; and incorporating improved black liquides with the identified plastic collector designs. Indoor weathering tests of various plastics have continued and two outdoor automated test facilities were constructed. One unit was installed at Columbus, Ohio, and the other unit was installed in Phoenix, Arizona. In addition, test facilities in Florida were utilized for static outdoor testing of candidate materials. Results indicate that the black liquid collector is a viable concept and the collectors manufactured during the course of this study, were able to perform as theoretically predicted. There are some long-term durabilty problems still associated with the black liquid collector systems. However, current indications are that a suitable system can be built that should have an expected lifetime of up to 15 years with only marginal (less than 10%) performance degradation. DOE

DEVELOPMENT OF HYDROCONVERSION OF BIOMASS TO SYNETHETIC FUELS. PROJECT 61042 TECHNICAL REPORT Technical Progress Report, 16 May - 30 Sep. 1980
Dec. 1980 57 p refs
(Contract DE-AC02-80CS-83004)
(DE82-000874; DOE/CS-83004/1) Avail: NTIS HC A04/MF A01

The objective of this program is to develop the hydroconversion (in-situ production and addition of hydrogen to carbonaceous species) of biomass (forest and crop residues) to produce substitute natural gas. The program will also include experiments to investigate the production of hydrocarbon liquids from biomass. Progress made during the first reporting period is reported. A list of recent biomass survey and availability literature was compiled; samples of wood materials were obtained for characterization, handling, and bench-scale testing. Standard chemical and physical tests for biomass materials were identified for use in characterizing each material and its char in the program. The initial analysis and testing began with a sample of Douglas fir hog fuel. Bench-scale hydrodevolatilization and char gasification tests were performed. Experiments with maple hardwood chips are in progress. A detailed report describing the process development unit design was submitted. DOE

N82-16530# Oak Ridge National Lab., Tenn.
MATERIALS TESTING FOR SOLAR-THERMAL CHEMICAL PROCESS HEAT
T. N. Tiegs Oct. 1981 63 p refs
(Contract W-7405-eng-26)
(DE82-002003; ORNL/TM-7833) Avail: NTIS HC A04/MF A01

Considerable interest has arisen recently in the production of hydrogen from water using solar thermal energy. The most advanced chemical cycles being developed in the United States and abroad all have the decomposition of sulfuric acid at elevated temperatures as the final step in the cycle. Materials required in the production of hydrogen were tested. The materials tested included (-)-SiC, siliconized SiC, MgO, ZrO2(Y2O3 stabilized), ZrO2(MgO stabilized), and silicon aluminum oxynitride (or sialon). Ring specimens of these materials were exposed for varying periods of time in a simulated H2SO4 decomposition environment at 1000 and 12250 C. The specimens were examined visually, metallographically, by X-ray diffraction, and with a scanning electron microscopes. In addition, the specimens were tested for changes in their fracture stress and weight. The silicon carbide materials, both alpha and siliconized, were the best performers. The other materials tested showed V)-iron(II) oxides of 10 kcal/mol, and the amount of analytical solution. DOE

THE CLASS C PASSIVE PERFORMANCE EVALUATION PROGRAM Final Report
Sep. 1981 24 p
(Contract DE-AC02-79CS-30150)
(DE82-C00454; MASEC-R-81-014; P-101-2) Avail: NTIS HC A02/MF A01

The Class-C performance which provides information on qualities of passive solar features which make them attractive to buyers was evaluated. The following topics are discussed: design of an audit form; design of regionally specific audit addenda; determination of site selection criteria; identification of sites; selection, training, and management of auditors; and packaging of materials of subcontractors for evaluation. Results and findings are presented as follows: demographic profile, passive solar home profile, cost, financing, and payback considerations, expectations, realizations, and satisfaction, and decisionmaking. DOE

BOISE CASCADE: INEL SOLAR HOME Data Report, 1 Jul. 1980 - 31 Mar. 1981

Ken H. Liebelt, Adrienne H. Novick, and James I. Mills Jul. 1981 107 p refs
(Contract DE-AC07-76ID-01570)
(DE82-003778; EGG-CS-5504) Avail: NTIS HC A06/MF A01

The operating data on the Bosie Cascade-INEL solar homes located in Boise and Idaho Falls, Idaho, are summarized for the period from July 1, 1980 through March 31, 1981. All three major system functions are discussed: space heating, domestic hot water heating, and space cooling. In addition, the update data acquisition system, which allows for simultaneous acquisition and analysis of data, and also the new data reduction and analysis capabilities are discussed. The general performance of the houses during the reporting period is summarized, but it is beyond the scope of this report to present a detailed analysis of the data or to completely address existing data anomalies. EFFECTS OF AMMONIA CONTAMINATION BY WATER ON OTEC POWER SYSTEM PERFORMANCE

C. B. Panchal, J. J. Lorenz, and D. L. Hillis Aug. 1981 51 p refs
(Contract W-31-109-eng-38)
(DE82-001832; ANL/OTEC-PS-8) Avail: NTIS HC A04/MF A01

Tests were conducted with evaporators produced by Trane, Johns Hopkins University's Applied Physics Laboratory (APL), and Linde to determine the loss in heat-transfer performance resulting from contamination of ammonia by water. A stepwise integration procedure was developed to determine the overall heat-transfer coefficients from experimental data. Results indicated that the heat-transfer coefficient of the evaporator decreases with increasing water content of the ammonia. At water concentrations below 0.1%, the reduction in the overall heat-transfer coefficient was less than 1% for all three evaporators. For more than 0.1% water, the loss in performance becomes increasingly significant. At 1% water, the reduction in the heat-transfer coefficient was found to be 4%, 8%, and 10%, for the Trane, APL, and Linde evaporators, respectively. DOE

ROTOR TESTING IN FY 1981

R. S. Steele, Jr. and E. F. Babelay, Jr. 13 Jul. 1981 8 p refs Presented at the Mech., Magnetic and Underground Energy Storage Ann. Contractors' Rev., Washington, D.C., 24-26 Aug. 1981
(Contract W-7405-eng-26)
(DE81-028340; Y/DX-338; CONF-810833-4) Avail: NTIS HC A02/MF A01

Flywheel spin tests conducted for the mechanical energy storage technology project are summarized. Two types of tests are discussed: (1) an ultimate speed test, which includes ultimate speed evaluations for a tapered, quasi isotropic, graphite composite flywheel, a constant thickness disk with an SMC core and circumferentially wound graphite restraining ring, and a constant thickness disk with an S-glass alpha-ply layup core and circumferentially wound graphite ring; (2) a cyclic fatigue test. A matching flywheel was used as the first test unit. Test results and general observations and conclusions are presented. DOE

OPELIKA RESOURCE RECOVERY PROJECT: REPORT ON THE TECHNOLOGICAL AND ECONOMIC EVALUATION

Jul. 1981 127 p refs
(Contract DE-FG01-79CS-20243)
(DE81-030098; DOE/CS-20243/1) Avail: NTIS HC A07/MF A01

A resource recovery facility for the city of Opelika, Alabama was investigated and surrounding areas were examined for waste stream characteristics. Technological options for waste disposal were examined. The technological options were ranked according to specific criteria of market characteristics, compatibility, and commercial viability. A particular resource recovery system applicable to Opelika was identified and an economic analysis performed to compare its relative costs to that of landfilling. DOE

COGENERATION POTENTIAL: ENHANCED OIL RECOVERY Final Report

R. M. Rodden and J. L. Boyen Aug. 1981 69 p refs Sponsored by EPRI
(EPRI Proj. 1276-7)
(DE81-904202; EPRI-EM-1996) Avail: NTIS HC A04/MF A01

The purpose of this project was to perform preliminary evaluation of the potential in the United States for generating electric power in connection with producing steam for the enhanced recovery of oil. The analysis identified the size and location of the heavy oil resource base and developed estimates of oil recovery potential. Using these data, estimates were made of electric power capacity that could result if cogeneration were used to supply the necessary steam for thermal recovery. Incentives and obstacles to the use of cogeneration for thermally enhanced oil recovery are identified and discussed. The attitudes of the utilities companies and the petroleum producers toward the possible use of cogeneration for thermal oil recovery are also identified and discussed. The report presents preliminary design information on cogeneration systems that would be suitable for thermally enhanced recovery. DOE

PASSIVE SOLAR PRODUCTS CATALOG, 1981

M. M. Dotseth 1981 362 p
(Contract DE-AC02-79CS-30150)
(DE82-000292; MASEC-H-81-041) Avail: NTIS HC A16/MF A01

The Passive Solar Products Catalog was compiled through contacts with over 500 manufacturers and distributors across the country. The product listings are from manufacturers who responded to requests for information and the descriptions are based on information contained in the product literature. Only those products which can be marketed at this time are listed in the 1981 catalog. The catalog contains over 300 product listings. The catalog is organized according to product function and application including passive solar components and design resonances and miscellaneous products. Manufacturer and product indexes are included as a cross reference in the back of the catalog. Distributors are not listed since most manufacturers prefer to have product inquiries initially directed to them. DOE

OTEC PERFORMANCE TESTS OF THE TRANE PLATE-FIN HEAT EXCHANGER

C. B. Panchal, D. L. Hillis, J. J. Lorenz, and D. T. Yung Apr. 1981 48 p refs
(Contract W-31-109-eng-38)
(DE82-001833; ANL/OTEC-PS-7) Avail: NTIS HC A03/MF A01

The Trane heat exchanger was tested as an evaporator, and separately as a condenser, at the following nominal operating conditions: water flow rate, heat duty, and ammonia feed rate (applicable to evaporator test only). Operated as an evaporator in the forced convection mode, the overall heat transfer coefficient (UO) of the unit was 1235 Btu/h.ft(2).OF. Tests were conducted at heat duties ranging from 2.4 million to 4 million Btu/h, and at ammonia feed rates ranging from 18 to 40 gpm. Operated as an evaporator in the falling film mode, at the same nominal conditions as listed above, U0 and 1035 Btu/h.ft(2).OF. At a constant heat duty, increasing ammonia feed rate from 22 to 50 gpm increased U0 by about 30%. Operated as a condenser, the unit's U0 was 870 Btu/h.ft(2).OF. DOE

SOLAR ENERGY SYSTEMS SIMULATION AND ANALYSIS Quarterly Progress Report, 1 Nov. - 30 Dec. 1980
Loren L. Vant-Hull 10 Jan. 1981 36 p refs
(Contract DE-AC03-76SF-10763)
(DE81-026975; DOE/SF-10763/T10; QPR-5) Avail: NTIS HC A03/MF A01

A subrountine to provide central receiver performance simulation code STEAEC with the capability of interpolating the UofH NS code performance summary has been written and is documented herein. A call of this subroutine obviates the need to extrapolate day/hour output efficiencies to produce the elevation-azimuth field performance data, which often involves non-physical Sun locations. The changes are completely transparent to the user. The aspect ratio study was delayed while substantive improvements to the handling of heliostate spacing subject to mechanical limits were made. Mechanical limits play a definitive roll as the aspect ratio increases. The improvements are described. Work on insolation modeling is being culminated with the development of a new procedure for accounting for atmospheric transmission losses between heliostat and receiver. A detailed interpolation/extrapolation procedure based on the LOWTRAN 3 analysis was developed. Subroutines to provide all the necessary input data were also generated. Work has begun on a tentative basis which will lead to a user compatible version of the IH code and to an accompanying users guide. DOE

PHOTOVOLTAIC MECHANISMS IN POLYCRYSTALLINE THIN-FILM SILICON SOLAR CELLS Final Report, 31 May 1979 - 30 May 1981
D. Redfield Jun. 1981 79 p refs
(Contract DE-AC01-79ET-23108)
(DE82-000868; DOE/ET-23108/8) Avail: NTIS HC A05/MF A01

The emphasis during this two-year program began with analysis of fundamental limitations to silicon solar-cell efficiency caused by heavy-doping effects. Near the middle, the emphasis shifted to explanation of the varied electronic properties of grain boundaries in Si. In the first area, and it was shown that all previous analyses which had neglected Auger recombination were necessarily invalid. Important consequences were also found for the strong gradients in dopant concentration that always occur in heavily doped diffused p-n junctions. When these new effects are combined, a simple, natural model results to explain limitations in Si solar-cell performance due to either front or base region effects on either J/sub sc/ or V/sub oc/. As part of this work, a new method was developed for accurate evaluation of the overall performance of AR coatings. DOE

DEVELOPMENTS IN SOLAR-POWERED AIR CONDITIONING: STATE-OF-THE-ART AND PROSPECTS FOR SOUTH AFRICA
A. Johannsen 1980 19 p refs Presented at Frigair Symp., Pretoria, 17-18 Jun. 1980; sponsored by the South African Inst. of Refrigeration and Air Conditioning
(PB81-246076; CSIR-ME-436; Paper-10) Avail: NTIS HC A02/MF A01 CSCL 13A

The state of the art of solar powered air conditioning is reviewed and its potential for South African conditions examined. Three basic cycles, namely the absorption cycle, the Rankine cycle, and desiccant cycle are discussed and their advantages and disadvantages compared. The open cycle type desiccant systems which appear to be well suited for South African conditions are discussed in greater detail. Included is a review of the various system configurations with solid and liquid desiccant and a comparison of their performance under different climatic conditions. Author

METHOD AND TECHNOLOGIES FOR REDUCING THE GENERATION OF METAL-BEARING SLUDGES AT AFLC INDUSTRIAL WASTE TREATMENT PLANTS Final Report, Jun. 1979 - May 1981
Anthony M. Wachinski Aug. 1981 126 p refs
(AF Proj. 2103)
(AD-A107552; AFESC/ESL-TR-81-29) Avail: NTIS HC A07/MF A01 CSCL 13/8

At present, the Air Force provides maintenance for its inventory of aircraft and associated systems at five industrial-complexes called Air Logistic Centers (ALCs). Wastewaters generated at the ALCs are treated by industrial waste treatment plants located on-site. The effluent is then discharged to a nearby stream or to a Privately Owned Treatment Works (POTW). During the period, 16 July 1979 to 3 May 1980, these facilities were surveyed for ways to reduce the volume of metal-bearing sludges generated by the IWTPs. Results of the surveys showed that the volume of sludge could be significantly reduced by a coordinated program of wastewater reduction, plating chemicals conservation, optimization of IWTP operation and sludge dewatering. Analyses of the sludges showed them to be nonhazardous by the EPA Toxicant Extraction Method. Data suggested that efforts to delist the sludges as nonhazardous were warranted. Also included are in-depth discussions of evaporation, ion exchange, and reverse osmosis and their application as recovery processes in Air Force electroplating operations. Author (GRA)

USE OF A PHENOLIC-CARBOXYLIC ACID CATION RESIN IN THE TREATMENT OF LOW-LEVEL LIQUID WASTE AT OAK RIDGE NATIONAL LABORATORY
J. M. Chilton Sep. 1981 18 p refs
(Contract W-7405-eng-26)
(DE82-000500; ORNL/TM-7524) Avail: NTIS HC A02/MF A01

The loading capacity of CS-100 resin, using plant waste as feed, was found to be significantly reduced after 20 loading-elution cycles, or less of the original capacity was retained after 30 cycles. Since the distribution coefficients for calcium and strontium are about six times greater than that for cesium, no loss of Sr 90 would be expected while Cs 137 is loading. Laboratory results obtained by using plant conditions and feed indicate that a typical bed would remove 96 percent of Sr 90 in the feed. Cobalt-60 is generally the greatest contributor to the radioactivity of the plant effluent. Laboratory tests indicate that this Co-60 is present as a mixture of a soluble anionic complex and insoluble colloids. The anionic complex could be removed by placing an anion exchange column in the effluent from the CS-100 resin bed. In studies of the dynamics of loading on CS-100 resin, the contact time in plant operation (3 to 4 min per column volume) was found to be more than adequate to obtain the desired results. DOE

ACID RAIN AND FOREST PRODUCTIVITY
D. W. Johnson 1981 37 p refs Presented at IUFRO Meeting, Kyoto, Sep. 1981
(Contract W-7405-eng-26; EPRI Proj. 1813-1)
(DE81-030916; Publ-1717; CONF-810967-1) Avail: NTIS HC A03/MF A01

It is noted that acid rain can cause increases or decreases in forest productivity depending on site nutrient status and the duration and rate of inputs. Some acid irrigation studies have shown short-term growth increases due to increased N availability, yet long-term growth reductions remain theortically possible because of cation depletion and toxic aluminum accumulations in soils. It cannot be overremphasized that the problem of assessing acid rain effects on forest productivity is one of quantification. Generalization about acid rain effects without reference to the amount of acidic input and site nutrient conditions are hazardous. DOE

ATMOSPHERIC DEPOSITION OF HEAVY METALS AND THEIR INTERACTION WITH ACID PRECIPITATION IN A NORTH AMERICAN DECIDUOUS FOREST

S. E. Lindberg, R. R. Turner, D. S. Shriner, and D. D. Huff 1981 4 p refs Presented at the Intern. Conf. on Heavy Metals in the Environment, Amsterdam, Sep. 1981
(Contract W-7405-eng-26)
(DE81-032004; CONF-810963-1) Avail: NTIS HC A02/MF A01

Atmospheric deposition dominates the landscape cycle of Pb and has a measurable influence on the cycles of Cd and Zn but a minimal influence on the Mn cycle in a deciduous forest in the eastern United States. Rain event deposition rates are orders of magnitude greater than the intervening dry deposition rates; however, dry deposition supplies 20 to 90 percent of the total annual input to the forest. Interactions between dry deposition and acid precipitation result in concentrations of metals and H(+) in the canopy 100 to 1000 times higher than rain concentrations alone. DOE

THERMODYNAMIC DATA FOR FLUE-GAS DESULFURIZATION PROCESSES

Leo Brewer Aug. 1981 56 p refs Presented at the FGD Symp., Morgantown, W. Va., 6-7 Nov. 1980
(Contract W-7405-eng-48)
(DE81-030545; LBL-11758; CONF-801176-1) Avail: NTIS HC A04/MF A01

Thermodynamic and kinetic data for the various materials that might be used in desulfurization processes resulting from cool and oil combustion are presented. Examination of the available thermodynamic data for sulfur compounds indicates serious uncertainties and a complete review is planned to provide the best set of internally consistent values obtainable from the literature and from current experiments. Although the main emphasis will be on information needed for aqueous limestone or lime slurry treatment, the data could also be used for other processes covering a wider temperature range. Thus it is planned to provide the data, when possible, for the range from room temperature to at least 1000K. The present compilation covers most of the materials that might play a role in SO2 extraction processes and for which data were found. Supplements will be issued as data are obtained for additional substances of interest. DOE

DENITRIFICATION OF NITRATE-CONTAINING HEAVY-METAL-FILTRATE SOLUTIONS

W. N. Whinnery 1 Jul. 1981 61 p refs
(Contract W-7405-eng-26)
(DE82-000701; KY-712) Avail: NTIS HC A04/MF A01

The results indicate that biodenitrification of the PGDP heavy metal wastes reduced the nitrate concentration from 129,000 ppM to 10 ppM. Although batch treatment of the heavy metal filtrate proved successful at a low denitrification rate, continuous operation was not accomplished due to the accumulation of heavy metals in the sludge and the high metal content of the feed solution. Effects of the heavy metal solution filtrate as the biodenitrification feed solution are presented in relation to reactor operation and performance. An economic evaluation of a typical plant scale biodenitrification system, using present generation rates, would result in a disposal cost of greater than $250/barrel. T.M.

N82-16559# Argonne National Lab., Ill. Integrated Assessments and Policy Evaluation Group.

FLUE-GAS DESULFURIZATION: REVIEW OF SELECTED COMMERCIAL AND ADVANCED TECHNOLOGIES

Jerry L. Gillette and Shen-Yann Chiu Feb. 1981 187 p refs
(Contract W-31-109-eng-38)
(DE82-001960; ANL/FE-81-51) Avail: NTIS HC A09/MF A01

Selected technologies for the desulfurization of flue gas are reviewed and evaluated. One of the technologies, wet scrubbing of the gas with a slurry containing either lime or limestone, has attained widespread commercial usage and for this reason is presented as the base case against which 10 second-generation systems of flue-gas desulfurization (FGD) are compared. The new technology include chemical-treatment, or scrubbing, processes and processes that combine scrubbing and filtering of the flue gas. The two combination processes use baghouse filters, with the SO2-collecting material either injected dry or sprayed into the system. The eight straight-scrubbing processes use either wet or dry collecting materials and are identified as follows: aqueous-carbonate, copper-oxide, Bergbau-Forschung, sodium-sulfite-based double-alkali, DOA double-alkali, Chiyoda-121, magnesia, and Wellman-Lord. DOE

FORMATION OF NO SUB x AND OTHER PRODUCTS FROM CHEMICALLY BOUND NITROGEN IN COAL COMBUSTION Final Report

David W. Blair and J. O. L. Wendt Jun. 1981 298 p refs
(Contract DE-AC21-77ET-11314)
(DE81-028536; DOE/ET-11314/T1) Avail: NTIS HC A13/MF A01

The purpose of this project was to advance the fundamental understanding of fuel nitrogen conversion in coal combustion towards the ultimate end of providing for the rational design of coal combustors with acceptably low NO/sub x/ outputs. In pursuit of this objective the program attacked the problem both experimentally and theoretically. Experimental work concentrated upon the pyrolysis stage of coal combustion. It investigated the loss of mass, nitrogen, and sulfur from the solid phase and the distribution of important chemical species in the pyrolyzate under simulated combustion heating conditions. Experimentally variables included temperature, heating rate, atmospheric reactivity, thermal history (preheating, reheating) and coal type. These experiments were performed upon twenty coals of widely varying types, two chars, and one petroleum coke. The results of the work suggest that the conditions of coal nitrogen conversion can be controlled by adjusting external variables. DOE

N82-16561# International Coal Refining Co., Allentown, Pa.

HAZARDOUS WASTE PRELIMINARY PLANNING REQUIREMENTS FOR SRC-1 DEMONSTRATION PLANT IN NEWMAN, KENTUCKY

29 May 1981 362 p refs Prepared for Kentucky Dept. of Natural Resources and Environmental Protection
(Contract DE-AC05-78OR-03054)
(DE82-001346; DOE/OR-03054/T8) Avail: NTIS HC A16/MF A01

The questions of soil types and permeability, suitability of the site for the proposed use, surface and subsurface geology, and hazards (seismic activities, flood, subsidence) are addressed. Information on the location and preliminary design concepts of hazardous waste disposal facilities are provided. The results of a geotechnical engineering study are reported along with an engineering interpretation of these with respect to the available project characteristics and recommendations to aid in the design and construction of foundations and other Earth related phases of the project. Additional liquefaction analyses were performed which considered both acceleration levels of 5 and 10% gravity and several flood conditions. T.M.

ADVANCED ENVIRONMENTAL CONTROL TECHNOLOGY PROGRAM

Aug. 1981 32 p refs
(DE82-000898; DOE/METC/SP-187) Avail: NTIS HC A03/MF A01

The Department of Energy has established the Advanced Environmental Control Technology Program to protect the environment while supporting the development of more efficient and acceptable technologies utilizing domestic fossil fuels. This program consolidates cleanup efforts in ongoing technology specific DOE programs (such as combustion and gasification, and cleanup projects transferred from EPA to DOE) with new project initiates into a coordinated program that addresses cleanup technology development. There are numerous problems associated with using coal to replace oil and gas as a primary fuel. Sulfur, nitrogen, alkali and halogen compounds, and mineral particulate matter, all found in varying proportions in the domestic coals, are released during gasification and combustion. These contaminants of coal, as well as the soot and tars produced by incomplete combustion or gasification, can potentially degrade the performance of the energy producing system. DOE

ASSESSMENT OF ENVIRONMENTAL HEALTH AND SAFETY ISSUES ASSOCIATED WITH THE COMMERCIALIZATION OF UNCONVENTIONAL GAS RECOVERY: DEVONIAN SHALE
Sep. 1981 88 p refs
(Contract DE-AC06-76RL-01830)
(DE82-001047; PNL-3848) Avail: NTIS HC A05/MF A01

Potential public health and safety issues and the potential environmental impacts from recovery of natural gas from Devonian age shale are identified. The resource and the DOE eastern gas shales project are described. The new and developing recovery technologies associated with Devonian shale are described. An assessment of the environment, health and safety impacts associated with a typical field is presented. The typical field for this assessment occupies ten square miles and is developed on a 40-acre spacing (that is, there is a well in each 40-acre grid). This field thus has a total of 160 wells. Finally, conclusions and recommendations are presented. A reference list is provided to give a greater plant. Based on the estimated plant cost and the various cases of operating income, an economic analysis was performed employing a profitability index criterion of discounted cash flow to determine an interest rate of return on the plant investment. STUDIES ON TOXICITY OF OTEC PLANT COMPONENTS ON MARINE ANIMALS FROM THE GULF OF MEXICO Final Report, 1 Sep. 1978 - 30 Nov. 1980
A. Venkataramiah, G. J. Lakshmi, Christine Best, Gordon Gunter, Eric Hartwig, and Patrick Wilde Jun. 1981 126 p refs Prepared jointly with California Univ., Berkeley. Lawrence Berkeley Lab.
(Contracts DE-AS02-78ET-20512; ET-78-S-02-5071)
(DE81-030167; DOE/ET-20512/T1) Avail: NTIS HC A07/MF A01

Ammonia and chlorine were chosen for toxicity studies as they pose the greatest potential environmental threat. Acute and chronic bioassays determined the LT sub 50 LC sub 50 and the behavior of filefish (Monocanthus hispidus). The chronic bioassays were carried out making in sublehal concentrations of ammonia and chlorine. It is indicated that high concentrations of ammonia and chlorine from the OTEC plants are toxic to marine animals and that the level of toxicity is related to the species, their habitats and life stages. PUBLIC HEALTH HAZARDS OF LURGI/FISCHER TROPSCH COAL LIQUEFACTION
J. R. Gasper and S. E. Rosenberg Jan. 1981 63 p refs
(Contract W-31-109-eng-38)
(DE82-001617; ANL-EES-TM-153) Avail: NTIS HC A04/MF A01

The public hazards of wastes from Lurgi/Fischer-Tropsch coal liquefaction were identified. Data on dose response and synergism are not available for many of the waste chemicals from this process. This approach employs two measures of hazards: (1) body burdens that result from exposure to Lurgi/Fischer-Tropsch wastes are compared to body burdens from other sources of the same chemicals; (2) ambient concentrations of pollutants from Lurgi/Fischer-Tropsch operations are projected and compared to various air and water quality standards. DOE

COMBUSTION ENHANCEMENT AND POLLUTANT-CONTROL RESEARCH WITH ACOUSTICALLY INDUCED MIXING Technical Progress Report, Jun. - Sep. 1981
R. J. Faeser and M. I. Rudnicki Sep. 1981 31 p
(Contract DE-AC22-80PC-40270)
(DE82-001100; DOE/PC-40270/2) Avail: NTIS HC A03/MF A01

An experimental research program was initiated to evaluate the possibility that beneficial effects can result when acoustic energy is impressed on the combustion zone of pulverized coal furnaces. These benefits include the reduction in NO/sub x/ generation, the increase in combustion intensity, and the increase in turndown ratio (maximum flow/minimum flow). The postulated reason for these possible benefits is the increased relative motion of the gas and coal particles and the fine stirring action resulting from high frequency acoustic waves. During the second, three-month period of this contract, the design and fabrication of the combustor were completed and the test facility buildup was 70% completed. A checkout test of the acoustic equipment and a preliminary acoustic survey test of the combustor response were also completed. DOE

SULFUR GAS EMISSIONS FROM STORED FLUE GAS DESULFURIZATION SOLIDS Final Report
D. F. Adams Oct. 1981 87 p refs Sponsored by Electric Power Research Inst.
(EPRI Proj. 856-2)
(DE82-900859; EPRI-EA-2067) Avail: NTIS HC A05/MF A01

The emissions of volatile, sulfur-containing compounds from the surfaces of 13 flue gas desulfurization (FGD) solids field storage sites were characterized. The sulfur gas emissions from these storage surfaces were determined by measuring the sulfur gas enhancement of sulfur-free sweep air passing through a dynamic emission flux chamber placed over selected sampling areas. Samples of the enclosure sweep air were cryogenically concentrated in surface-deactivated Pyrex U traps. Analyses were conducted by wall-coated, open-tubular, capillary column, cryogenic, temperature-programmed gas chromatography using a sulfur-selective flame photometric detector. Several major variables associated with FGD sludge production processes were examined in relation to the measured range and variations in sulfur fluxes including: the sulfur dioxide scrubbing reagent used, sludge sulfite oxidation, unfixed or stabilized (fixed) RGD solids, and ponding or landfill storage. The composition and concentration of the measured sulfur gas emissions were found to vary with the type of solids, the effectiveness of rainwater drainage from the landfill surface, the method of impoundment, and the sulfate/sulfite ratio of the solids. FULL-SCALE DEMONSTRATION OF INDUSTRIAL WASTE-WATER TREATMENT UTILIZING DU PONT'S PACT (TRADE NAME) PROCESS Final Report, Nov. 1976 - Dec. 1979
Harry W. Heath, Jr. Sep. 1981 164 p refs
(Grant EPA-S-804943)
(PB81-248122; EPA-600/2-81-159) Avail: NTIS HC A08/MF A01 CSCL 13B

Operating and cost data on startup and the initial 30 months of operation of 150,000 cu m/day industrial wastewater treatment plant using Du Pont's PACT process are reported. The process effectively provides secondary/tertiary treatment by adding powdered activated carbon to the aerator in an activated sludge process. Removals were consistent even though the waste contained many relatively toxic, nonbiodegradable organics and varied drastically in composition. A synergistic enhancement of biological activity in the presence of activated carbon was observed. Activated carbon was regenerated in a multiple hearth furnace. GRA

CONSERVATION OF COOLING WATER BY SILICA REMOVAL WITH ACTIVATED ALUMINA
Richard Mouche and Jack V. Matson 1980 44 p refs
(Grant NSF PFR-79-17072)
(PB81-247959; NSF/RA-800535) Avail: NTIS HC A03/MF A01 CSCL 13B

Activated alumina which selectively and effectively remove silica from water was investigated. Batch isotherm tests were performed to find out how much silica could be adsorbed by a known quantity of activated alumina and kinetic studies were performing to reveal temperature effects on the rate of adsorption. It is suggested that the sidestream activated alumina process has both environmental and economic benefits over the conventional cooling water systems. GRA

ASSESSMENT OF EMERGING TECHNOLOGIES FOR METAL FINISHING POLLUTION CONTROL: THREE CASE STUDIES Final Report, Apr. - Dec. 1980
Philip A. Militello Aug. 1981 74 p refs
(Contract EPA-68-03-2907)
(PB81-244485; EPA-600/2-81-153) Avail: NTIS HC A04/MF A01 CSCL 13B

Approaches to treatment of electroplating wastewater were evaluated. The most promising of these were selected for further investigation to include sampling performance verification, and cost analysis. The treatment methods include a system for treatment of electroplating wastes with ozone, a technique for chrome recovery by ion transfer, and a method of treating mixed wastestreams using ion exchange. Performance of each of these technologies was evaluated through sampling and analysis of prototype operation under normal production conditions. Performance data and cost projections for each system are presented herein. T.M.

ON-SITE WASTEWATER TREATMENT PROBLEMS AND ALTERNATIVES FOR WESTERN NORTH CAROLINA
Steven J. Berkowitz Jun. 1981 154 p refs Prepared in cooperation with Univ. of Western Carolina, Cullowhee, N.C.
(PB81-240541; UNC-WRRI-81-163; W81-04661;
OWRT-A-999-NC(54;)) Avail: NTIS HC A08/MF A01 CSCL 13B

The results of a project intended to help improve wastewater management in the western North Carolina mountains by developing a comprehensive picture of the region's on site wastewater management practices and related problems are summarized. It provides a basis for evaluating the potential role alternative practices and programs could play in solving these problems. Four representative mountain counties--Graham, Haywood, Jackson, and Macon--were analyzed in detail. Approximately 100,000 people live in 40,000 homes within the four study counties. About three quarters of these homes depend on individual wastewater disposal systems, primarily conventional septic tank systems. GRA

POLYCHLORINATED BIPHENYL TRANSPORT IN THE HUDSON RIVER, NEW YORK Final Water-Resources Investigation, 1976-1977
John T. Turk and David E. Troutman Mar. 1981 18 p refs Prepared in cooperation with Board of Water Commissioners of the Town of Waterford, N.Y. and New York State Dept. of Environmental Conservation
(PB81-249757; USGS/WRD/WRI-81/079; USGS/WRI-81-9) Avail: NTIS HC A02/MF A01 CSCL 13B

The PCB concentrations in the Hudson River at Waterford, New York are controlled by two processes. At discharges that are not extremely high (less than 600 cubic meters per second) a constant flux of PCB's from bottom deposits is the major source. At discharges greater than 600 cubic meters per second, resuspension of bottom materials containing PCB's is the principal mechanism. PCB concentration resulting from either or both processes can be predicted from river discharge by equations developed and verified in this study. The transport rate of PCB's into the Hudson River estuary is approximately 1,700 kilograms per year, of which about 40 percent is transported at discharges greater than 600 cubic meters per second. IMPACT OF TOPOGRAPHIC CIRCULATIONS ON THE TRANSPORT AND DISPERSION OF AIR POLLUTANTS Final Report, Oct. 1978 - Apr. 1981
Roger A. Pielke and Richard T. McNider Aug. 1981 224 p refs
(Contract EPA-R-806207)
(PB82-102435; EPA-600/4-81-068) Avail: NTIS HC A10/MF A01 CSCL 13B

A numerical mesoscale model is utilized to examine slope flows and the classic mountain plain circulation for idealized topography. Special emphasis is given to turbulent parameterization in the stable boundary layer and the unique characteristics of turbulent mixing in the slope flows. A Lagrangian particle model, operating in the terrain following coordinate system of the mesoscale model, was developed to examine pollutant transport in the modeled circulations while a Markov statistical process was used to evaluate turbulent dispersion. Results of dispersion tests in the modeled slope flows showed enhanced vertical dispersion in the slope flows, compared to flow over a flat boundary, and importantly, that normal surface scaling parameters for pollutant dispersion such as friction velocity were inappropriate for the slope flows. FEDERAL INITIATIVE FOR CLEAN AIR: INSPECTION AND MAINTENANCE
Feb. 1981 87 p
(Contract EPA-68-02-2535)
(PB82-102500; EPA-907/9-81-001; PN-3280-V) Avail: NTIS HC A05/MF A01 CSCL 13B

The regulation new car emissions and ensurance that the production of vehicles, if properly maintained, will meet applicable emission standards throughout their useful life is discussed. Inspection/maintenance (I/M) aims at the control of motor vehicle emissions and the reduction of air pollution through required periodic inspection of motor vehicles and maintenance of those that do not pass inspection. It is estimated that a properly operated designed I/M program can reduce auto air pollution emissions by 20 to 30% after several years of program implementation. GRA

EXHAUST EMISSIONS FROM HIGH-MILEAGE CATALYST-EQUIPPED PASSENGER CARS
Gary T. Jones Jul. 1981 15 p refs
(PB82-103326; EPA-AA-TEB-81-20) Avail: NTIS HC A02/MF A01 CSCL 13B

Vehicles from the 1975 through 1981 model years were used to examine the effect of 'high mileage' on levels of exhaust emissions. The emission levels from the vehicles involved were examined from four basic views: (1) 'as received' results of the top 15% (by odometer) versus similar results from the bottom 15% and 85%; (2) 'as received' results of vehicles with over 50,000 miles versus those with under 50,000; (3) the effects of restorative maintenance on high mileage vehicles; and (4) the effects of catalyst replacement on high mileage vehicles. The results show that the high mileage vehicles exhibit higher average HC and CO emissions than the lower mileage vehicles. It was also found that on the averge, catalytic converters remain active beyond a vehicle's statutory 'useful life' of 50,000 miles and that restorative maintenance is an effective method to reduce average emission levels. (Contract EPA-68-03-2648)
(PB82-103870; EPA-600/2-81-208) Avail: NTIS
HC A16/MF A01 CSCL 13B

The goal of this study was to identify and assess methods that could be used to accelerate the restoration of lands damaged by spills of hazardous materials. The literature was reviewed to determine what response methods had been used in the past to clean up spills on land and identify other techniques that could be developed for detoxification of hazardous, spill-damaged lands. Four biological techniques were evaluated for accelerating the restoration of spill-damaged lands in the laboratory. The techniques and the chemicals used were the following: (1) enhancement of microbial degradation by indigenous for chlorobenzene and ethion organisms; (2) addition of mixed microorganisms from primary sewage for formaldehyde and aniline; (3) addition of adapted/mutant microbial cultures for dinitrophenol and chlordane; and (4) selective absorption by harvestable plants for lead and cadmium. HC A05/MF A01 CSCL 13B

The use and evaluation of several remote sensing techniques in conjunction with direct sample collection to develop a systematic approach for subsurface investigations at uncontrolled hazardous waste sites is described. Remote sensing techniques were employed to determine the extent (and sequence) to which they may be integrated with the more conventional methods of test drilling, installation of monitoring wells, and excavation for determining information such as the following: ground water contamination, presence and number of buried drums, topography and condition of bedrock, and costs and effectiveness of several abatement methods. Both the remote sensing and conventional sampling methods were used at an abandoned hazardous waste dump in Coventry, Rhode Island. GRA

EMISSION CHARACTERISTICS OF 1979 AND 1980 CALIFORNIA PASSENGER CARS EQUIPPED WITH THREE-WAY CATALYSTS
Gary T. Jones and Matthew M. Macocha Aug. 1981 18 p refs
(PB82-105073; EPA-AA-TEB-81-24) Avail: NTIS HC A02/MF A01 CSCL 13F

Exhaust emissions data gathered on in use vehicles equipped with three way catalyst systems are presented. Information on current systems in customer use for projections on the ability of the three way system to meet emission standards of the future were obtained. It is indicated that vehicles equipped with these systems are capable of achieving low exhaust emission levels although high levels do occur due to defects, deterioration or tampering with the emission control equipment. GRA

FUEL ECONOMY AND EXHAUST EMISSIONS OF A METHANOL-FUEL CHEVETTE
H. Anthony Ashby May 1981 7 p refs
(PB82-101783; EPA-AA-TEB-81-23) Avail: NTIS HC A02/MF A01 CSCL 13F

The results of a series of tests conducted over a period of several months on a 1979 Chevrolet Chevette powered by anhydrous methanol are presented. Baseline tests with gasoline were also conducted about three months before the methanol test series began. The exhaust emissions from this car were greatly affected by air-fuel ratio and state of tune. Driveability was not good during most tests when CO met Federal standards. The best optimized adjustments gave a 10 percent better energy efficiency on pure methanol than on gasoline with approximately similar exhaust emission levels. GRA

UNREGULATED EXHAUST EMISSIONS FROM NONCATALYST BASELINE CARS UNDER MALFUNCTION CONDITIONS Final Report, Jun. 1980 - May 1981
Charles Urban May 1981 185 p refs
(Contract EPA-68-03-2884)
(PB82-101130; EPA-460/3-81-020) Avail: NTIS HC A09/MF A01 CSCL 13F

Laboratory efforts to characterize regulated and unregulated exhaust emissions from 1970 model noncatalyst gasoline automobiles operating under malfunction conditions are described. Four automobiles were evaluated over three driving schedules in the unmodified configuration and in up to three engine and/or emission control system malfunction configurations. Exhaust emission constituents measured, in addition to the currently regulated emissions, include: particulates, sulfates, aldehydes, sulfides, amines, metals and several additional elements and compounds. Additional evaluations in each of the configurations involved the measurement of the regulated emissions over four short test procedures. GRA

ESTIMATING MOBILE SOURCE POLLUTANTS IN MICROSCALE EXPOSURE SITUATIONS Final Report, Jan. 1980 - Feb. 1981
Melvin N. Ingalls Jul. 1981 162 p refs
(Contract EPA-68-03-2884)
(PB82-101114; EPA-460/3-81-021) Avail: NTIS HC A08/MF A01 CSCL 13F

The concentration of any vehicle generated pollutant in areas where people are in close proximity, to vehicles (microscale exposure situations) was estimated. The situations studied are: residential garages, parking garages, tunnels, street canyons and expressways. For each of the situations dispersion model was selected for use in obtaining pollutant concentrations. The exposure level for each case was determined by calculating the pollutant concentrations for typical and severe actual situations. Actual locations were chosen to represent the typical and severe exposure for each situation. Pollutant concentrations were calculated by using the chosen dispersion models. GRA

SPRAY CHARGING AND TRAPPING SCRUBBER FOR FUGITIVE PARTICLE EMISSION CONTROL Final Report, Aug. 1978 - Aug. 1980
Shui-Chow Yung, Julie Curran, and Seymour Calvert Jul. 1981 265 p refs
(Contract EPA-68-02-3109)
(PB82-115304; EPA-600/7-81-125) Avail: NTIS HC A12/MF A01 CSCL 13B

The control of fugitive particle emissions (FPE) with a Spray Charging and Trapping (SCAT) Scrubber that uses an air curtain and/or jets to contain, convey, and divert the FPE into a charged spray scrubber was evaluated. The effects of charge levels on drops and particles, nozzle type, drop size, gas velocity, and liquid/gas ratio on collection efficiency were determined. It is shown that collection efficiency can be improved by charging the water and/or particles. Measured particle penetration agrees with theoretical predictions for the unaugmented scrubber. For the electrostatically augmented scrubber, measured penetration is lower than predicted. An air curtain was developed for conveying the FPE to the spray scrubber. The design and air flow field for the air curtain are presented. GRA

HOURLY DIURNAL FLOW VARIATIONS IN PUBLICLY-OWNED WASTEWATER TREATMENT FACILITIES Final Report, 1979
Sep. 1981 122 p refs
(Contract EPA-68-03-2775)
(PB82-107954; EPA-600/2-81-218) Avail: NTIS HC A06/MF A01 CSCL 13B

Sanitary sewer collection systems were surveyed to determine the magnitude of hourly peak flows and to identify parameters most influencing the observed peaks. The significant parameters include: industrial contribution, collection system age, depth to groundwater and low lift preplant pumping stations. Collection systems with larger industrial contributions had higher peak flows than those with small industrial contributions. Variations in peak flows were exhibited between spring and summer periods in high groundwater and among old age systems due to infiltration during the spring season. Low lift preplant pumping stations create extremely high peak flows and pulses that do not reflect normal diurnal influent flow patterns. GRA

A SUMMARY OF THE EPA NATIONAL SOURCE PERFORMANCE AUDIT PROGRAM - 1980 Final Report
R. G. Fuerst, E. W. Streib, and M. R. Midgett Oct. 1981 68 p refs
(PB82-108127; EPA-600/4-81-077) Avail: NTIS HC A04/MF A01 CSCL 13B

A national quality assurance audit program for methods used in stationary source tests was conducted in 1980 by the Quality Assurance Division of the Environmental Monitoring Systems Laboratory, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina. In this program, quality assurance materials were sent to interested participants for the measurement of a gas volume (dry gas meter only) or the analysis of liquid samples simulating collected sulfur dioxide and nitrogen oxides. Each participant returned the analytical results to the Source Branch, Quality Assurance Division, for evaluation. An individual report was returned to each participant after processing. This report summarizes the audit results of 1980 for those three source test methods. GRA

PERFORMANCE OF TRICKLING FILTER PLANTS: RELIABILITY, STABILITY, VARIABILITY Final Report
Richard Haugh, Salar Niku, Edward D. Schroeder, and George Tchobanoglous Sep. 1981 111 p refs
(Grant EPA-R-805097)
(PB82-108143; EPA-600/2-81-228) Avail: NTIS HC A06/MF A01 CSCL 13B

Effluent quality variability from trickling filters was examined. Distributions of most effluent data were skewed to the right, and daily suspended solids data exhibited more variation than daily BOD5 data. Three distributions, two parameter empirical, gamma and lognormal were adequate. Daily effluent BOD5 and suspended solids data contained both random and nonrandom components. Effluent BOD and suspended solids concentrations were higher in winter than in summer when pooled data from all plants was examined. Multiple regression analysis determined the effects of various process parameters on effluent quality. Primary effluent BOD5 and suspended solids concentrations and wastewater temperature had the greatest effect. Methods to incorporate statistical concepts into trickling filter design and operation are discussed. GRA

HEAVY METAL SOURCES AND FLOWS IN A MUNICIPAL SEWAGE SYSTEM: LITERATURE SURVEY AND FIELD INVESTIGATION OF THE KOKOMO, INDIANA SEWAGE SYSTEM Final Report, Oct. 1977 - Jan. 1981
K. J. Yost, R. F. Wukasch, T. G. Adams, and Bert Michalczyk Sep. 1981 282 p refs
(Grant EPA-R-805631)
(PB82-108366; EPA-600/2-81-224) Avail: NTIS HC A13/MF A01 CSCL 13B

The flow of heavy metals (Cu, Ni, Cr, Cd, Zn, PB) and cyanide in the Kokomo, Indiana collection system and wastewater treatment plant was analyzed. The relative contributions of domestic and nondomestic sources to the total pollutant load in the system, were determined. The levels of discharge control required for the disposal of municipal sludge by landfill or agricultural landspreading were assessed. Sampling was conducted at point source locations, in major sewer trunk and feeder lines, and at the treatment plant. Production and waste treatment data are presented for point sources sampled to characterize metal and cyanide discharges as a function of these parameters. GRA

WASTEWATER TREATMENT FACILITIES. TWINING WATER AND SANITATION DISTRICT, TAOS COUNTY, NEW MEXICO Draft Environmental Impact Statement
Aug. 1981 284 p refs
(PB82-104670; EPA-906/9-81-002) Avail: NTIS HC A13/MF A01 CSCL 13B

The Twining Water and Sanitation District has considered alternatives for wastewater management which would solve a pollution problem in the high-quality Rio Hondo watershed of northern New Mexico. The district proposes construction of a new advanced treatment plant with a capacity of 95,000 gallons per day. A major alternative is to rehabilitate the existing plant and provide only the capacity needed to treat existing wastewater flows (83,000 gallons per day). EPA is considering approval and funding of either alternative (as well as providing no funding). Many complex issues bear on EPA's decision, including impacts on water quality, water supply, and socio-economic conditions. GRA

SURFACE CHEMICAL TECHNOLOGY FOR IMPROVED WETTING OF COAL DUST Open File Report, 13 Sep. 1979 - 13 Sep. 1980
Nathan Feldstein Feb. 1981 50 p refs
(Contract DI-BM-JO-199050)
(PB82-104654; BM-OFR-127-81) Avail: NTIS HC A03/MF A01 CSCL 13B

The wetting of coal dust by aqueous solutions of surface active agents (surfactants) was studied. Thirty coals and typical surfactants were selected. The wetting of the coals was examined by column flow, contact angle, and settling rate measurements. Results indicated that both anionic and nonionic surfactants are to be considered viable for use; low critical micelle concentration values are also preferred for the surfactants. Native waters showed variation in pH, calcium ion concentration, and conductance. Combinations of nonionic and anionic surfactants have, in certain instances, produced synergistic enhancement in the coal wetting superior to the effectiveness of each surfactant alone. GRA

TECHNIQUES FOR HANDLING LANDBORNE SPILLS OF VOLATILE HAZARDOUS SUBSTANCES Final Report
D. Brown, R. Craig, M. Edwards, N. Henderson, and T. J. Thomas Sep. 1981 101 p refs
(Contract EPA-68-02-1323)

(PB82-105230; EPA-600/2-81-207) Avail: NTIS HC A06/MF A01 CSCL 13B

Response needs of teams charged with handling spills of hazardous volatile materials on land are considered. Items of hardware which could be adapted or developed to improve spill response capabilities are suggested. The available technology employed in current spill responses is examined. The phenomena that accompany spill volatilization are assessed to determine and justify physical/chemical mechanisms that could potentially be used to control the hazards arising from volatility. A set of spill scenarios is developed to compare the new suggested technology items with current spill response procedures. GRA

OIL SLICK DISPERSAL MECHANICS Final Report
Chukwuka A. Osamor and Robert C. Ahlert Sep. 1981 238 p refs
(Grant EPA-R-805901)
(PB82-105560; EPA-600/2-81-199) Avail: NTIS HC A11/MF A01 CSCL 13B

The spreading and dissolution behavior of small oil slicks formed from spills of 12 oils was investigated. The increases in area covered by the oils during spreading experiments were determined using photographic techniques. The rate of dissolution of the oils in tap water at 25 C were investigated by equilibrating oils with water in open static tests. Limits of solubilities were established for the oils from equilibration in closed vessels. Six oils were also equilibrated with salt water. A segmented mathematical model were derived and used to correlate experimental data. The primary mechanisms are quantified by analogy to homogeneous and heterogeneous catalysis and detergency. Parameters investigated include oil and dispersant types, oil to dispersant ratios, degree of agitation, and the effect of salt water. GRA

DEMONSTRATION OF A LONG-RANGE ATMOSPHERIC TRACER SYSTEM USING PERFLUOROCARBONS
Gilbert J. Ferber, Kosta Telegadas, Jerome L. Heffter, C. Ray Dickson, Russell N. Dietz, and Philip W. Krey Apr. 1981 84 p refs
(Contract DE-AI01-80EV-10081)
(PB82-106246; NOAA-TM-ERL-ARL-101; NOAA-81080301) Avail: NTIS HC A05/MF A01 CSCL 13B

Regional-scale tracer experiments are needed to validate atmospheric dispersion aspects of air pollution models. The capability of a new system, using perfluorocarbon tracers (PFTs), for long-range dispersion experiments at reasonable cost was demonstrated in two experiments. Two PFTs (C7F14 and C8F16) were released simultaneously with SF6 and two heavy methanes. The PFT system provides automatic sequential samplers and rapid, inexpensive analyses down to 2 parts per 10 to the + 15th power of air. PFT concentrations were measured 600 km away, up to three days after release. Performance of the PFT system was excellent and a consistent set of tracer data was obtained. GRA

HYDROGEN SULFIDE GENERATION BY REACTION OF NATURAL GAS, SULFUR AND STEAM Report of Investigations, Jul. 1981
S. R. Crane, Laird Crocker, and W. I. Nissen Jul. 1981 61 p refs
(PB82-106998; BM-RI-8539) Avail: NTIS HC A04/MF A01 CSCL 13B

A regenerable flue gas desulfurization process was developed. The citrate process uses a buffered weak acid solution to absorb SO2 from the waste gas. The absorbed SO2 is reacted with H2S to precipitate elemental sulfur and regenerate the solution for recycle. The H2S feedstock xor the process may be produced by reacting two-thirds of the recovered elemental sulfur with natural gas and steam. Laboratory investigations and pilot plant operations were conducted by the Bureau to determine if H2S from the natural gas, sulfur, and steam reaction was suitable for the citrate process. The laboratory investigations, in which an H2S generator was integrated with other citrate process operations, provided a basis for design and operation of the pilot plant. The objective was to provide H2S for citrate process pilot plant. GRA

GUIDELINES FOR THE USE OF CHEMICALS IN REMOVING HAZARDOUS SUBSTANCE DISCHARGES
C. K. Akers, R. J. Pilie, and J. G. Michalovic Sep. 1981 82 p refs
(Contract EPA-68-03-2093)
(PB82-107483; EPA-600/2-81-205) Avail: NTIS HC A05/MF A01 CSCL 13B

Guidelines were developed on the use of various chemical and biological agents to mitigate discharge of hazardous substances. Eight categories of mitigative agents and their potential uses in removing hazardous substances discharged on land and in waterways are discussed. The agents are classified as follows: (1) Mass Transfer Media; (2) Absorbents; (3) Thickening and Gelling Agents; (4) Biological Treatment Agents; (5) Dispersing Agents; (6) Precipitating Agents; (7) Neutralizing Agents; and (8) Oxidizing Agents. The classification of each agent is developed in terms of: (a) Characteristic properties of the mitigative agent; (b) Potential spill situations on which the agent could be used; (c) The effects on the environment caused by use of the agent; (d) Possible toxic side effects caused by byproduct formation; and (e) Recommendations for use of the agent. EVALUATION OF ON-SITE WASTEWATER TREATMENT AND DISPOSAL OPTIONS Final Report, Oct. 1977 - Oct. 1978
David H. Bauer, E. T. Conrad, and Donald G. Sherman Sep. 1981 234 p refs
(Contract EPA-68-03-2627)
(PB82-101635; EPA-600/2-81-178) Avail: NTIS HC A11/MF A01 CSCL 13B

Conceivable alternatives of on site systems, wastewater manipulation, treatment and disposal options were identified. Wastewater manipulation includes flow reduction, wasteload reduction and waste segregation. Treatment options include disinfection, biological, and physical/chemical methods. Disposal options included air, soil and surface water methods, and practical combinations. An equipment inventory to determine the availability of hardware for the systems and system components was performed. Performance, operation and maintenance, environmental acceptability, and total annual cost for 15 specific site conditions were evaluated. Site conditions are defined by soil percolation rate, soil depth, slope, available land area, direct discharge effluent requirements, and net evaporation. GRA

(PB82-103573; EPA-600/7-81-071B) Avail: NTIS
HC A14/MF A01 CSCL 06F

Results and conclusions are given of a source test and evaluation program at a coal preparation plant, representing cleaning plants that process run of mine coal with high pyritic sulfur content, use high technology coal cleaning processes, operate in a high rainfall environment, and have a low soil neutralization potential. The major objective of the program was to perform an environmental assessment on the plant's waste streams and fugitive emissions. Chemical analysis results indicated that all streams, except fugitive particulates, contained constituents which may have a potentially harmful health and/or ecological effect. For streams showing potential for ecological effects, Mn was of concern for streams showing a potentially harmful health effect. Mn and Or were of prime concern. Contrary to previous studies, high NI-13 concentrations were observed in the leachate. Further investigation of the NI-13 source is warranted. Bioassays for fugitive particulates, sedimentation pond waters, and fine refuse slurry solid samples indicated moderate biological effects. GRA

DENSITY LEVELS OF PATHOGENIC ORGANISMS IN MUNICIPAL WASTEWATER SLUDGE, A LITERATURE REVIEW Final Report
Dana C. Pedersen Sep. 1981 298 p refs
(Contract EPA-68-03-2803)
(PB82-102286; EPA-600/2-81-170) Avail: NTIS
HC A13/MF A01 CSCL 13B

Density levels of indicator and pathogenic organisms in municipal wastewater sludges and septage were examined. The effectiveness of conventional municipal sludge stabilization processes (mesophilic anaerobic and aerobic digestion, composting and lime stabilization) and dewatering processes (drying beds, lagooning/storage, and sludge conditioning/mechanical dewatering) was evaluated for reducing density levels of indicator and pathogenic organisms. All literature published on this topic between 1940 and 1980 was reviewed. An annotated bibliography presents all citations reviewed, with pertinent abstracts and methods used by researchers. GRA

ENGINEERING AND ECONOMIC ASSESSMENT OF AUTOHEATED THERMOPHILIC AEROBIC DIGESTION WITH AIR AERATION Final Report
Sep. 1981 48 p refs
(Contract EPA-68-03-2803)
(PB82-102310; EPA-600/2-81-171) Avail: NTIS
HC A03/MF A01 CSCL 13B

A major disadvantage of aerobic digestion is that it requires long detention times, particularly in colder climates, to insure adequate stabilization. Autoheated thermophilic aerobic digestion (ATAD) offers the potential to decrease the required detention time. ATAD takes advantage of the heat generated by microoganisms as they degrade organic material. Heat losses are controlled so that the system will be self heating (authothermal) and reach thermophilic range (at least 45 C). ATAD is shown to be feasible with a mixture of thickened waste activated and primary municipal sludge. ATAD systems appear economical compared with ambient aerobic digestion and anaerobic digestion. The system is also more effective in decreasing the pathogen content of sludge. T.M.

WASTEWATER DECHLORINATION STATE-OF-THE-ART FIELD SURVEY AND PILOT STUDIES Final Report, Jun. 1973 - Sep. 1979
Ching-Lin Chen and Henry B. Gan Sep. 1981 104 p refs
(Contracts EPA-14-12-150; EPA-68-03-2745)
(PB82-102336; EPA-600/2-81-169) Avail: NTIS
HC A06/MF A01 CSCL 13B

The utility and efficiency of the sulfur dioxide method was determined and a cost-effectiveness comparison of sulfur dioxide and two other methods of dechlorination, namely, activated carbon and holding tank processes is provided. Pilot-scale testing indicates that no degradation of physical and chemical water quality occurred in the dechlorinated effluents from any of the three dechlorination processes investigated. The field survey involved the canvassing of 55 operating plants and although overdosing of sulfur dioxide was frequently necessary to meet the residual chlorine discharge standards, most installations found pH adjustment and reaeration of the dechlorinated effluent unnecessary. Process cost estimates indicate that sulfur dioxide process is the most cost-effective method for dechlorination. T.M.

HC A10/MF A01 CSCL 13B

The inactivation of parasites by lime stabilization of sewage sludges seeded with selected intestinal parasites was investigated. Sludge samples examined in each of the four seasons from 27 municipal wastewater treatment plants indicated the following: viable eggs of Ascaris and Toxocara were observed at least once from every plant; viable eggs of T. vulpis and T. trichiura were observed at least once from 26 and 15 plants, respectively, and viable eggs of at least 10 other helminths and cysts of a few protozoa were observed in fewer numbers and less frequently. Certain drying bed conditions such as previous sludge stabilization, high temperature, and low moisture content appear to inactivate parasite eggs synergistically between 60 percent to 5 percent sludge moisture content. Laboratory studies indicate that destruction of resistant parasite eggs is primarily due to temperature and not to a specific digestion process. T.M.

FUEL NOx CONTROL BY CATALYTIC COMBUSTION Final Report, Oct. 1978 - Apr. 1979
E. K. Chu, K. D. Seifert, R. M. Kendall, and J. P. Kesselring Sep. 1981 103 p refs
(Contract EPA-68-02-2611)
(PB82-102351; EPA-600/7-81-151; IERL-RTP-1247) Avail: NTIS HC A06/MF A01 CSCL 13B

Operating conditions for catalytic combustors that give low levels of NOx emissions for fuel-bound nitrogen compounds were defined, and fuel nitrogen during catalytic combustor was determined. Fuel NOx emissions are strongly dependent on catalyst type; however, varying mass throughput, bed temperature, fuel, and fuel nitrogen type had virtually no effect on fuel NOx. The dominant nitrogenous products resulting from the catalytic combustion of a nitrogen containing fuel were NO, N2, NH3, and HCN. GRA

SIMPLIFIED NOISE STRATEGY MANUAL
Mones E. Hawley Jul 1981 98 p refs
(Contract EPA-68-01-4944)
(PB81-243016) Avail: NTIS HC A05/MF A01 CSCL 13B

A manual system for planning the noise control strategy for abating a community's noise problems is described. It assists communities in determining, in an objective manner, the efficient allocation of funds for reducing the adverse effects of noise in their community. A noise planner is assisted in selecting the most cost effective noise abatement measures and the amount of money which should be spent on each. The primary criterion for optimization is based on economic and acoustical data gathered in the community. GRA

POLLUTION PROBLEMS OF THE GREAT LAKES REGION. REPORT OF THE GREAT LAKES REGION CONFERENCE
Russel Moll, ed., Suzanne Tainter, ed., and Stephen R. Schneider, ed. Jan. 1981 74 p refs Conf. held at Traverse City, Mich., 9-11 Jun. 1981
(PB81-246951; UMICH-SG-81-900; NOAA-81070804; Working-Paper-3) Avail: NTIS HC A04/MF A01 CSCL 08H

The most important pollution problems of the Great Lakes were identified. Important problem areas are: the impact of pollutants of human health, the impact of pollutants on overall ecosystem health, the longevity or reversibility of the consequences of the pollutant, the areal extent of the pollutant, and the future magnitude of the problem. Topics discussed are: food and fiber production water uses; industrial water uses; municipal water uses; recreation and wildlife water uses; social, economic and institutional water uses; and transportation water uses. COMMUNITY NOISE ATTITUDINAL SURVEY GUIDELINES
Jul. 1981 147 p
(Contract EPA-68-01-3840)
(PB81-244295) Avail: NTIS HC A07/MF A01 CSCL 13B

The community noise assessment manual provides a comprehensive and computerized system for assessing the noise problems of a community and then planning a noise control strategy for its abatement. This report provides a procedure for implementing a survey of people's attitudes toward noise. An attitudinal questionnaire to be administered to city residents is provided. The procedures for using a probability sampling techniques to estimate the characteristics of the population are provided and a method for analyzing the collected data is discussed. GRA

RELATIONSHIP OF WATER QUALITY OF HUDSON RIVER, NEW YORK DURING PEAK DISCHARGES TO GEOLOGIC CHARACTERISTICS OF CONTRIBUTING SUBBASINS Final Report, 1977 - 1979
John T. Turk and David E. Troutman 1981 22 p refs Prepared jointly with Board of Commissioners of the Town of Waterford, N.Y. and New York State Dept. of Environmental Conservation
(PB81-249740; USGS/WRD/WRI-81-078; USGS/WRI-80-108) Avail: NTIS HC A02/MF A01 CSCL 08H

Water samples from two Hudson River floods in 1977, one originating mainly in shale subbasins that produce high sediment loads, the other in soil poor, crystalline rock terrain that yields little sediment, were analyzed to evaluate the relationship of iron, manganese, lead, phosphorus, and polychlorinated biplanyis (PCB's) to suspended sediment concentration. During the flood of high sediment discharge, ratios for all substances studied except PCB's reflected their concentration within the basin regolith. During the flood of smaller magnitude, from the low sediment crystalline terrain, however, only the ratio for iron correlated with predicted concentrations in the basin, which suggests that the chemical constituents studied were contributed principally from other sources, possibly antropogenic sources. OPERATION AND MAINTENANCE COSTS FOR MUNICIPAL WASTEWATER FACILITIES
Sep. 1981 140 p refs
(PB81-249971; EPA-430/9-81-004; FRD-22) Avail: NTIS HC A07/MF A01 CSCL 13B

The results of the latest and most comprehensive effort to obtain and analyze operation and maintenance costs for wastewater treatment works are presented. Data from more than 900 treatment plants and almost 500 conveyance systems throughout 40 of the 48 contiguous United States, including all ten EPA regions is summarized. Included is information on administrative costs, sludge handling costs, and staffing. Basic information from site visits was combined into a simple data base and examined for relationships between total operation and maintenance costs, facility design parameters, and plant operation parameters. These relationships were developed for the general national level and, where possible, for smaller geographic units. Where appropriate in analyzing the data, total operation and maintenance costs were reduced to their major components. GRA

CRITERIA FOR EVALUATING THE IMPLEMENTATION PLAN REQUIRED BY THE EARTHQUAKE HAZARDS REDUCTION ACT OF 1977
1980 79 p
(PB81-241663; OTA-BP-X-2) Copyright. Avail: Issuing Activity CSCL 08K

The Earthquake Hazards Reduction Act of 1977 which proposes to reduce the risk to life and property from future earthquakes by establishing and maintaining an earthquake hazards reduction program is discussed. The Act also required that an implementation plan be submitted to Congress within 210 days of enactment. Fourteen basic issues or conflicts with which the implementation plan must cope in order to achieve its objectives are identified. These issues and the associated questions developed under each of them in the text comprise criteria which may be useful to Congress in its evaluation of the plan. GRA

IONOSPHERIC DISTURBANCES PROPAGATING EASTWARD IN A LOW LATITUDE DETECTED BY VHF POLARIMETERS

I. J. Kantor, M. A. Abdu, and I. S. Batista Aug. 1981 16 p refs In PORTUGUESE; ENGLISH summary Presented at the 33d Reuniao Anal da SBPC, Salvador, Jul. 1981

(INPE-2202-PRE/011) Avail: NTIS HC A02/MF A01

Simultaneous measurements of the total electron content (TEC) through observations of the Faraday rotation angle of vhf signals transmitted by the GOES-1 geostationary satellite, using polarimeters located at Sao Jose dos Campos geographic coordinates (23 deg S, 46 deg W) and Cachoeira Paulista geographic coordinates (23 deg S, 45 deg W), show disurbances in TEC propagating eastward. These disturbances occur especially in the period between sunset and midnight and are associated with spread F as detected in the Cachoeira Paulista ionograms. Statistics of these events, their velocities and their association with equatorial spread F are presented. T.M.

NUMERICAL SIMULATION OF RAYLEIGH-TAYLOR INSTABILITY IN THE EQUATORIAL IONOSPHERIC PLASMA [SIMULACAO NUMERICA DA INSTABILIDADE RALYEIGH-TAYLOR NO PLASMA IONOSFERICO EQUATORIAL]

Y. Nakamura, J. H. A. Sobral, and M. A. Abdu Jul. 1981 28 p refs In PORTUGUESE; ENGLISH summary Presented at the 33rd Reuniao Anual de SBPC, Salvador, Brazil, 1981

(INPE-2172-RPE/388) Avail: NTIS HC A03/MF A01

Ionospheric irregularities near the magnetic equator are studied. A numerical simulation is done for the generation and evolution of the ionospheric bubble based on the theory of the collisional Rayleigh-Taylor instability for two fluids, for the magnetic equatorial region. The regions of depletion in density were assumed to be aligned with the Earth's magnetic field, extending from higher altitudes at the equatorial region down to the arbitrary height of 150 km. Assuming the electron density profile perturbed by the bubble, the 6300 A intensity was calculated for various latitudes arbitrarily taken within the photometer scanning range. The calculated airglow results show that, as the bubble moves upward, the disturbance in the airglow intensity propagate from north to south, in agreement with observed results. Author

NUMERICAL SIMULATION OF THE INTERACTION OF THE PLASMA SHEET WITH THE LOBES OF THE EARTH'S MAGNETOTAIL

Daniel W. Swift [1982] 46 p refs

(Grants NsG-7625; NSF AM-79-23614)

(NASA-CR-168508) Avail: NTIS HC A03/MF A01 CSCL 04A

Codes involving one and two spatial dimensions and three velocity dimensions were used to model the Earth's magnetotail. It was shown that the magnetotail can become inflated as a consequence of low energy plasma convection toward the neutral plane. The computer study exhibits a conversion of both magnetic field energy and of energy supplied by the convection electric field into particle energy. The numerical simulations suggest that much of the magnetotail substorm morphology may be a simple consequence of an increase, followed by a decrease, in the convection electric field, without the requirement of any magnetospheric size scale plasma instability or other disruptive processes. It is also concluded that the presence of the convection electric field and a continuing replenishment of low energy particles in the magnetotail are both necessary for maintenance of the magnetotail. DOUBLE LAYERS ON AURORAL FIELD LINES

M. K. Hudson, W. Lotko, and E. Witt [1982] 22 p refs

(Grant NAGw-75)

(NASA-CR-165113) Avail: NTIS HC A02/MF A01 CSCL 04A

Time-stationary solutions to the Vlasov-Poisson equation for ion holes and double layers were examined along with particle simulations which pertain to recent observations of small amplitude (e phi)/t sub e approx. 1 electric field structures on auroral field lines. Both the time-stationary analysis and the simulations suggest that double layers evolve from holes in ion phase space when their amplitude reaches (e phi)/t sub e approx. 1. Multiple small amplitude double layers which are seen in long simulation systems and are seen to propagate past spacecraft may account for the acceleration of plasma sheet electrons to produce the discrete aurora. DYNAMICS OF MAGNETOSPHERE-IONOSPHERE COUPLING INCLUDING TURBULENT TRANSPORT

Robert L. Lysak and Christian T. Dum [1982] 4 p refs

(Grant NAGw-75)

(NASA-CR-165098) Avail: NTIS HC A02/MF A01 CSCL 04A

A two dimensional two-fluid MHD model including anomalous resistivity was used to investigate the dynamics of magnetosphere-ionosphere coupling. When a field-aligned current is generated on auroral field lines, the disturbance propagates towards the ionosphere in the form of a kinetic Alfven wave. When the current exceeds a critical value, microscopic turbulence is produced, which modifies the propagation of the Alfven wave. This process is modeled by a nonlinear collision frequency, which increases with the excess of the drift velocity over the critical value. Turbulence leads to absorption and reflection of the Alfven wave, partially decoupling the generator from the ionosphere. The approach to a steady-state is strongly dependent on the presence or absence of the turbulence. The current is self-limiting, since a current in excess of critical causes a diffusion of the magnetic field perturbation and a reduction of current. Author

PREDICTION OF EARTH ROTATION AND POLAR MOTION

Sheng Yuan Zhu Sep. 1981 39 p refs

(Grant NsG-5265)

(NASA-CR-163468; Rept-320) Avail: NTIS HC A03/MF A01 CSCL 08E

Based on the analysis of the polar motion behavior, the possibility of predicting polar motion up to one year in advance was found. Comparing these predicted polar coordinates with the observed ones (smoothed), the root mean square (rms) of the differences is about 0.02 seconds. The differences of the relative polar motion are much smaller. For any time interval of 20 to 30 days throughout the whole year, the rms of the relative polar motion differences is about 0.01 second. Compared with the short available VLBI results (from 1977 to 1980), the rms of pred. to obs. is 0.013 seconds, and the relative rms (for time intervals less than two months) is 0.008 seconds (here the observed data is unsmoothed). It appears that 80 to 90% of the polar motion is composed of the stable, predictable Chandler and annual terms. The UT1-UTC has more complicated changes than polar motion making it difficult to find a satisfactory method of long term prediction. So far the rms prediction error is 0.0023 s for up to 30 days. N.W.

USE OF BACK AZIMUTH MEASUREMENTS IN SEISMIC EVENT LOCATION WITH REGIONAL DATA

D. W. Rivers, J. A. Burnetti, and A. C. Chang Alexandria, Va. VELA Seismic Center 9 Jan. 1981 84 p refs
(Contract F08606-79-C-0007; DARPA Order 2551)
(AD-A106429; SDAC-TR-81-3; VSG-TR-81-17) Avail: NTIS HC A05/MF A01 CSCL 17/1

Conventional methods for seismic event location, which are based on measurements of signal arrival times, may be inadequate for events detected at only regional distances, because there may be an insufficient number of observations. This shortcoming can be alleviated by supplementing the measurements of P-wave arrival times with measurements of the event's back azimuth made by applying Smart's (1978) three-component processor to the regional phase Lg. Back azimuth measurements can also be used as an analyst's tool to calculate an approximate epicenter for use in the association of mixed events with the appropriate signal arrivals or for use as the initial value in an iterative location scheme. An algorithm is herein presented which performs event location by treating arrival time measurements and back azimuth measurements in an analogous fashion. Tests of this algorithm which were run in the depth-restrained mode for two events show that it can be effective for sparse data sets but also that it can lead to large errors if there is a poor geometrical distribution of detecting stations. Computations of the confidence region about the epicenter demonstrates an insufficiency in the theory for calculating F-statistic confidence ellipses for azimuths and travel-time data if the measurement variances are not known a priori. The theory is satisfactory for the standard chi-squared ellipses. Author (GRA)

TROPOSPHERIC: STRATOSPHERIC TIDAL INVESTIGATIONS. PART 3: HOUGH COMPONENTS OF SURFACE PRESSURE Final Scientific Report, 1 Dec. 1976 - 30 Sep. 1981

Gerald V. Groves and A. Wilsch 31 Aug. 1981 50 p refs
(Grant AF-AFOSR-3224-77; AF Proj. 6687)
(AD-A106386; AFGL-TR-81-0301) Avail: NTIS HC A03/MF A01 CSCL 04/1

The report contains two papers. In the first of these, diurnal and semidiurnal Hough components of surface pressure are evaluated by classical tidal theory for previously presented profiles of water vapour and ozone heating and the values obtained are compared with the observed results of Haurwitz and Cowley (1973). The second paper presents profiles of terdiurnal ozone and water vapour heating from which the corresponding surface pressure oscillations are evaluated by classical tidal theory and compared with earlier evaluations and observationally derived results. In both papers the calculations underpredict the observed values and indicate a need for additional tidal heating to be identified. Author (GRA)

GRAVITATIONAL AGGLOMERATION OF POST-HCDA LMFBR NONSPHERICAL AEROSOLS Ph.D. Thesis - Missouri Univ. - Rolla

Ronald Forrester Tuttle Dec. 1980 274 p refs
(AD-A106766; AFIT-CI-80-82D) Avail: NTIS HC A12/MF A01 CSCL 13/7

A theoretical investigation of collisional dynamics of two particle interactions in a gravitational field is reported. This research is unique in that it is the first attempt at modeling the hydrodynamic interactions between a nonspherical particle and a spherical particle undergoing gravitational collisions in an LMFBR environment. Basic definitions and expressions are developed for nonspherical particles and related to spherical particles by means of shape factors. Using volume equivalent diameter as the defining length in the gravitational collision kernel, the aerodynamic shape factor, k, the density correction factor, alpha, and the gravitational collision shape factor, beta, are used to correct the collision kernel for the case of collisions between aerosol agglomerates. The Navier-Stokes equation in oblate spheroidal coordinates is solved to model a nonspherical particle and then the dynamic equations for two particle motions are developed. A computer program NGCEFF is constructed, the Navier-Stokes equation is solved by the finite difference method, and the dynamical equations are solved by Gear's method. It is concluded that the aerosol gravitational collision shape factor can be determined by further theoretical work based on the concepts and methods developed in this dissertation. GRA

VECTOR ELECTRIC FIELDS Final Report, 1 Oct. 1974 - 30 Sep. 1980

Forrest S. Mozer 29 Sep. 1981 5 p refs
(Contract N00014-75-C-0294)
(AD-A106784) Avail: NTIS HC A02/MF A01 CSCL 04/1

Funds provided by this contract were used to design and build the first electric field experiment that has successfully measured magnetospheric electric fields above the ionosphere, and to analyze the electric field data thereby obtained. The instrument was flown into an elliptical polar orbit on the S3-3 satellite where it made measurements for about two years following its July, 1977 launch. The S3-3 satellite was, perhaps, the most important magnetospheric satellite launched in the past decade, since it discovered and studied the low altitude particle acceleration region that produces discrete auroral arcs and much of the magnetospheric energetic ion population. During the period of this contract, twenty-one scientific papers were written on these topics, invited papers were presented at an additional twelve meetings. In the year following termination of this contract, an additional eleven scientific papers have been either published or submitted for publication. A bibliography of these publications is attached. THE ROLE OF HISS IN MAGNETOSPHERIC CHORUS EMISSIONS

Harry C. Koons 28 Sep. 1981 54 p refs
(Contract F04701-80-C-0081; Grant NSF ATM-80-19060)
(AD-A106479; TR-0081(6960-06)-10; SD-TR-81-77) Avail: NTIS HC A04/MF A01 CSCL 04/1

The simultaneous presence of narrowband hiss emissions with ELF chorus emissions outside of the plasmasphere are discussed. Chorus emissions are often observed to start at frequencies that are within a hiss band. Spectra show large variations in amplitude between adjacent bins with relative maxima 10 to 15 db above adjacent minima. Electrons in a narrow range of energies and pitch angles are organized in phase by the Doppler shifted cyclotron resonance with the large amplitude spectra components in the hiss band. The bandwidth of the cyclotron resonance is sufficiently narrow so that the electrons are not dephased by waves in adjacent portions of the highly structured spectrum. The amplitude of the hiss is sufficient to significantly phase bunch the electrons in the calculated interaction time. The chorus emission is generated as the phase bunched electrons moves adiabatically along the geomagnetic field line. This mechanisms accounts for the chorus emissions detected at frequencies above a hiss band in the Jovian magnetosphere. E.A.K.

THE CONVERSION OF AIRCRAFT ICE CRYSTAL MEASUREMENTS INTO TERMS OF LIQUID WATER USING SIMULATED DATA Interim Report

Robert O. Berthel 16 Jun. 1981 46 p refs
(AF Proj. 6670; AF Proj. 2310)
(AD-A106419; AFGL-TR-81-0173; AFGL-ERP-745) Avail: NTIS HC A03/MF A01 CSCL 04/1

This investigation presents simulated environments of ice crystals to computer analysis as a means of imitating particle measurements made by electro-optical devices such as the Particle Measuring System's 1-D instrument. A mathematical model is developed so that single crystals of known geometric form can be processed by considering each crystal's spatial relationship to the assumed measuring instrument. Crystal orientation is defined using a random number technique. The results of the assumed measurements are converted into mass of equivalent liquid water by different methods and are compared with the known mass of the simulated environment. Relationships are derived for the conversion of several forms of single ice crystals into terms of equivalent melted diameters of liquid water and a comparison is made between the mass calculated from the derived equations with the conversion equations relating measured length to equivalent melted diameter currently in use.

COMPARISON OF THE DYNAMIC PROCESSES DURING MAJOR AND MINOR STRATOSPHERIC WARMINGS IN A NUMERICAL MODEL M.S. Thesis - Utah Univ.

James Howard Davenport Jun. 1981 109 p refs
(AD-A106371; AFIT-CI-81-29T) Copyright. Avail: Issuing Activity CSCL 04/1

In this study we have analyzed the processes involved in a major and minor warming hased on data generated from a 31-layer primitive equation spectral model consisting of a 5-layer troposphere, 12-layer stratosphere and 14-layer mesosphere. The forcing of the model consisted of orographic features designed to simulate the major Northern Hemisphere continents. This gave a combination of wave number 1 and wave number 2 forcing. The analysis of the simulated major and minor warmings indicated several similarities and differences between the cases. The initial difference between the cases is that case 1 (major warming) had a weak polar vortex, while case 2 (minor warming) had a strong polar vortex. This resulted in case 2 having much larger turbulent flux terms, but not sufficient to reverse the mean polar winds. Case 1 produces a major warming in the polar stratosphere.

LOW-ENERGY ION PITCH-ANGLE DISTRIBUTION IN THE OUTER MAGNETOSPHERE: ION ZIPPER DISTRIBUTIONS

J. F. Fennell, D. R. Croley, Jr., and S. M. Kaye (Lockheed Missile and Space Co., Palo Alto, Calif.) 28 Sep. 1981 31 p refs
(Contract F04701-80-C-0081)
(AD-A106153; TR-0081(6960-05)-15; SD-TR-81-81) Avail: NTIS HC A03/MF A01 CSCL 04/1

Ion pitch-angle distributions, measured in a near synchronous orbit, are predominantly field-aligned at low energies and predominantly peaked perpendicular to the magnetic field at higher energies. The transition from field-aligned fluxes to fluxes peaked predominantly perpendicular to the magnetic field occurs over a very narrow energy range. These ion distributions have been observed at all local times between 5.3 Re and 7.8 Re. This transition energy correlates between the ion transition energy and magnetic local time, L, Kp, or Dst.

MAGNETIC SHELL TRACING: A SIMPLIFIED APPROACH

Janet G. Luhmann and Michael Schulz 15 Sep. 1981 22 p refs
(Contract F04701-80-C-0081)
(AD-A106714; TR-0081(6960-05)-9; SD-TR-81-78) Avail: NTIS HC A02/MF A01 CSCL 04/1

We consider the adiabatic motion of electrons trapped in the model geomagnetic field derived from a scalar potential. The drift shell is specified analytically (i.e., by an approximation given in closed form) in terms of the equatorial pitch angle. The 'radial gradient' is inferred from the diurnal variation of particle flux. This procedure offers an internal test for the absence of time-varying coefficients in the expansion of V. The pitch-angle distribution is directly observed at the noon meridian. The parameters thus determined allow the pitch-angle distribution at other longitudes to be obtained from Liouville's theorem. The results, at least for a well-studied test case, are comparable in quality to those obtained by more difficult methods, using a more complicated field model and the data from two spacecraft, i.e., are in similarly good agreement with the observational data obtained at other longitudes. In particular, we find that the maximum flux at alpha sub 0 = pi/2 occurs at noon (phi = pi) and that the maximum flux j(alpha sub 0, phi = 0) at midnight (phi = 0) occurs at alpha sub 0 not = pi/2.

A CLIMATE INDEX DERIVED FROM SATELLITE MEASURED SPECTRAL INFRARED RADIATION Ph.D. Thesis

Michael David Abel Apr. 1981 160 p refs
(AD-A106733; AFIT-CI-81-46D) Avail: NTIS HC A08/MF A01 CSCL 04/1

This thesis introduces a climate index based on radiative transfer theory and derived from the spectral radiances typically used to retrieve temperature profiles. It is assumed that clouds and climate are closely related and a change in one will result in a change in the other. Because the index developed in this paper is primarily a function of the cloud distribution and also dependent upon temperature and moisture distributions, it may be used as a climate index. The advantage is that the index is more accurately retrieved from satellite data than cloudiness per se. This index, hereafter referred to as the VIRES index (for Vertical Infrared Radiative Emitting Structure), is based upon the shape and relative magnitude of the broadband weighting function of the infrared radiative transfer equation. The broadband weighting curves (VIRES curves) are retrieved from simulated satellite infrared sounder data (spectral radiances). The VIRES index is a useful means of classifying the VIRES curves. This thesis describes the retrieval procedure and investigates error sensitivities of this method. Advantages of the approach include: day and night capability, no need to know cloud radiative properties, retrieval ability when cloud fraction or cloud emittance is less than 1.0, retrieved information below sensor resolution, minimum influence on the index from low tropospheric retrieval errors, and the ability to statistically discriminate between VIRES curves retrieved from different scenes. Operational VIRES index retrieval strategies and a number of specific applications are also proposed.

AN ALTERNATE APPROACH TO THE MEASUREMENT OF SOIL SURFACE HEAT FLUX M.S. Thesis - Arizona Univ.

Bruce Rex Merrill 1981 59 p refs
(AD-A106741; AFIT-CI-81-33T) Avail: NTIS HC A04/MF A01 CSCL 08/13

A new approach to the measurement of the conductive heat flux at the soil surface is presented. This approach provides the means to make measurements of the soil conduction heat flux. By sensing the temperature of the soil surface and using a temperature control circuit one forces an artificially created portion of the soil surface to mimic the temperature of the natural surface. By monitoring the power to maintain this control one makes a direct measurement of the conduction heat flux at the soil surface. Although the present instrument works only when the conduction heat flux is directed out of the ground there is nothing in principle to prevent the instrument from working when the flux is in the other direction. The error analysis shows that the two main sources of error are due to the electronics design and the errors associated with measuring the true temperature of a surface. Laboratory testing shows that unexplained error amounts to only a few percent at most. Laboratory testing also shows that the instrument is capable of measuring fluxes down to tenths of milliwatts per square centimeter.

ANALYSIS OF DATA FOR THE DEVELOPMENT OF DENSITY AND COMPOSITION MODELS OF THE UPPER ATMOSPHERE Final Report, 1 Jun. 1978 - 31 May 1981

Luigi G. Jacchia and Jack W. Slowey Hanscom AFB, Mass. Jul. 1981 19 p refs

(Contract F19628-78-C-0126; AF Proj. 6690)
(AD-A106420; AFGL-TR-81-0230) Avail: NTIS HC A02/MF A01 CSCL 04/1

This work was directed toward the ultimate goal of developing an improved model of the temperature, density and composition of that region of the Earth's neutral atmosphere above the turbopause. A wealth of data has become available, mainly in the form of total density and composition from satellite-borne mass-spectrometers, in recent years. Most of the work performed under the contract consisted of the analysis of data from the ESRO 4 mass spectrometer with a view towards improvement of the model of the geomagnetic variation in the thermosphere and exosphere. AN OVERVIEW, CURRENT STATUS, AND FUTURE PLANS FOR THE DOE ATMOSPHERIC STUDIES IN COMPLEX TERRAIN (ASCOT) PROGRAM

Marvin H. Dickerson Jun. 1981 5 p refs Presented at AMS Second Conf. on Mt. Meteorol., Steamboat Springs, Colo., 10-13 Nov. 1981 Submitted for publication
(Contract W-7405-eng-48)
(DE81-024417; UCRL-85725; CONF-811104-2) Avail: NTIS HC A02/MF A01

The problem of pollutant transport over complex terrain is investigated. The nocturnal valley drainage flow is chosen as the initial focus of the ASCOT program. The Geyser geothermal area in northern California is the initial study site. Objectives were defined as: (1) to augment the present knowledge of the physical mechanisms involved in the development, perpetuation, and breakup of nocturnal drainage flows; (2) to develop an integrated measurement and modeling methodology to perform as quality impact assessment and control strategies for energy development in areas subject to drainage flows; and (3) to provide the developed methodology with special applications to the H2S emissions associated with the Geysers geothermal development. EFFECTS OF CONFINING PRESSURE, PORE PRESSURE AND TEMPERATURE ON ABSOLUTE PERMEABILITY

Brian D. Gobran, Henry J. Ramey, Jr., and W. E. Brigham Oct. 1981 115 p refs
(Contract DE-AC03-76ET-12056)
(DE81-030336; DOE/ET-12056/27) Avail: NTIS HC A06/MF A01

The absolute permeability of consolidated sandstone and unconsolidated sand cores to distilled water as a function of the confining pressure on the core, the pore pressure of the flowing fluid, and the temperature of the system was studied. It is found that inaccurate measurement of temperature at ambient conditions and non-equilibrium of temperature in the core can lead to a fictitious permeability reduction with temperature increase. The results of this study on the effect of confining pressure and pore pressure support the theory that as confining pressure is increased or pore pressure decreased, the permeability is reduced. The effects of confining pressure and pore pressure changes on absolute permeability are given explicitly. DOE

SYNOPTIC SCENARIO OF THE INVASION OF COLD AIR DURING THE FREEZE OF MAY 1979 AND FROST MAPPING TO FORECAST AREAS OF MAJOR RISK

Michael Fortune Jul. 1981 4 p refs In PORTUGUESE; ENGLISH summary Presented at the 2nd Brazilian Agrometeorology Congr., Pelotas, 5-10 Jul. 1981
(INPE-2166-RPE/383) Avail: NTIS HC A02/MF A01

Satellite images obtained at INPE were analyzed with synoptic data from drifting buoys, radiosondings, and satellite winds and soundings when a strong invasion of polar air led to damaging frosts in Brazil. The analysis showed: a long wave in the west central Pacific began to amplify unusually three days before frontogenesis and five days before the severest frosts in Brazil, with the superposition of a short wave on the deepening long wave trough in Argentina, frontogenesis occurred. The next day this front surged rapidly into Brazil, and was accompanied by four or more squall lines. The front reached within 1 deg. of the equator, and the extraordinarily deep trough channelled subantarctic air into Brazil under clear skies, this led to severe frost in five southern states. S.L.

NUMERICAL AND FLIGHT SIMULATOR TEST OF THE FLIGHT DETERIORATION CONCEPT Interim Report

John McCarthy and Vern Norviel Washington NASA Jan. 1982 37 p refs
(Contract NAS8-33458)
(NASA-CR-3500; M-370) Avail: NTIS HC A03/MF A01 CSCL 04B

Manned flight simulator response to theoretical wind shear profiles was studied in an effort to calibrate fixed-stick and pilot-in-the-loop numerical models of jet transport aircraft on approach to landing. Results of the study indicate that both fixed-stick and pilot-in-the-loop models overpredict the deleterious effects of aircraft approaches when compared to pilot performance in the manned simulator. Although the pilot-in-the-loop model does a better job than does the fixed-stick model, the study suggests that the pilot-in-the-loop model is suitable for use in meteorological predictions of adverse low-level wind shear along approach and departure courses to identify situations in which pilots may find difficulty. The model should not be used to predict the success or failure of a specific aircraft. It is suggested that the pilot model be used as part of a ground-based Doppler radar low-level wind shear detection and warning system. T.M.

STUDY TO PERFORM PRELIMINARY EXPERIMENTS TO EVALUATE PARTICLE GENERATION AND CHARACTERIZATION TECHNIQUES FOR ZERO-GRAVITY CLOUD PHYSICS

EXPERIMENTS Final Report
Ulrich Katz Washington NASA Jan. 1982 195 p refs
(Contract NAS8-32313)
(NASA-CR-3486; M-368) Avail: NTIS HC A09/MF A01 CSCL 04B

Methods of particle generation and characterization with regard to their applicability for experiments requiring cloud condensation nuclei (CCN) of specified properties were investigated. Since aerosol characterization is a prerequisite to assessing performance of particle generation equipment, techniques for characterizing aerosol were evaluated. Aerosol generation is discussed, and atomizer and photolytic generators including preparation of hydrosols (used with atomizers) and the evaluation of a flight version of an atomizer are studied. EFFECTS OF DIABATIC HEATING ON THE AGEOSTROPHIC CIRCULATION OF AN UPPER TROPOSPHERIC JET STREAK Interim Report
Dennis Arthur Keyser and Donald R. Johnson Jan. 1982 135 p refs
(Contract NAS8-33222)
(NASA-CR-3497; M-369) Avail: NTIS HC A07/MF A01 CSCL 04B

Interaction between the mass circulation within a mesoscale convective complex (MCC) and a direct mass circulation in the entrance region of an upper tropospheric polar jet streak was examined within the isentropic structure to investigate mechanisms responsible for linking these two scales of motion. The results establish that latent heating in the MCC modifies the direct mass circulation in the jet streak entrance region through the diabatically induced components of ageostrophic motion analyzed within isentropic coordinates. Within the strong mesoscale mass circulation of each MCC, strong horizontal mass flux convergence into the MCC at low levels is balanced by strong horizontal mass flux divergence away from the convergence at upper levels. Locations of large diabatic heating rates correspond well to the MCC position for each case; diabatic heating forces the upward vertical branch for the mesoscale mass circulation. T.M.

Avail: NTIS HC A08/MF A01 CSCL 04B

Modeling, prediction, and analysis of global meteorological phenomena influencing the large scale behavior of the atmosphere are summarized. Prediction of global weather phenomena based on satellite data is discussed and models of global phenomena developed. The atmospheric general circulation model (AGCE) is reviewed, axisymmetric flow calculated, and axisymmetric states in cylindrical, spherical, three dimensional, and spin up numerical models for AGCE described. The role of latent heat release in baroclinic waves, latent heat and cyclonic systems, and a theoretical study of baroclinic flow related to the AGCE and the flow regime were studied with a simplified general circulation model. AGCE and the geophysical fluid flow cell (GFFC) instrumentation are discussed. Investigation of solar and planetary convection for GFFC is described. The utilization of satellite cloud observations to diagnose the energy state and transformations in extratropical cyclones is reviewed. J.D.H.

DEVELOPMENT OF A LARGE SCALE CLOUD SYSTEM, 23-27 MARCH 1978
Ian D. Cohen 4 May 1981 111 p refs
(AF Proj. 2310)
(AD-A106417; AFGL-TR-81-0127; AFGL-ERP-739) Avail: NTIS HC A06/MF A01 CSCL 04/2

The visual and microphysical properties of a large scale cloud system are described as that system developed from an open wave in Oklahoma to a deep occlusion covering most of the east coast of the United States. Microphysical properties examined include particle size, liquid water content, particle density, crystal type, and Form Factor (a measure of uniformity of particle sizes within a sample). Visual and microphysical observations were made at four levels, approximately at the 400, 400, 700, and 850-mb surfaces, on four consecutive days. On each day the

MC-130E aircraft instrumented for cloud physics research by AFGL flew at each level for approximately 30 minutes. In addition to examination of the continuous data provided by the aircraft, a detailed examination of 32 samples of 2 min each was undertaken. Sampling was conducted in the northeast quadrant of the storm. During the first day, the storm was mainly convective in nature, and as a result, had high liquid water content and particle distributions which were uniform along the vertical axis. As the storm moved eastward, it became more stratified. As it did, the observed particle size and types showed greater variations. The upper levels were affected less than the lower levels, thus reducing the uniformity along the vertical axis. As the system occluded, it lost moisture, producing smaller hydrometeors, lower liquid water content, and lighter precipitation at the surface. Later, an influx of water air increased the liquid water content and the intensity of the precipitation. GRA

WINTER AND SUMMER MEASUREMENTS OF EUROPEAN VERY LOW ALTITUDE VOLUME SCATTERING COEFFICIENTS Interim Scientific Report

Richard W. Johnson Jun. 1981 26 p refs
(Contract F19628-78-C-0200; AF Proj. 7670)
(AD-A106363; SIO-REF-81-26; AFGL-TR-81-0154; ISR-5)
Avail: NTIS HC A03/MF A01 CSCL 04/2

This report presents measurements of atmospheric volume scattering coefficients collected during twenty-nine low altitude flights made during the winter and summer seasons of 1978 at four different European locations. The measurements were conducted during an instrumented aircraft's final approach and landing at its staging airbase. The measurements were made using a pseudo-photopic spectral response and thus are suitable for comparison with data associated with standard visual determinations of airfield visibility. The data illustrate that in twenty-six of twenty-nine cases, there was little or no significant variation in the value of scattering coefficient as the aircraft approached the surface from an altitude of several hundred meters. PRECIPITATION FIELD AND INTRASTORM FLOW OF SUPERCELL CONVECTIVE STORMS Final Report

Daniel James McMorrow Aug. 1981 280 p refs
(Grant AF-AFOSR-0063-80; AF Proj. 2310)
(AD-A106752; AFOSR-81-0699TR) Avail: NTIS
HC A13/MF A01 CSCL 04/2

Single-Doppler radar data, when supplemented by surface and upper-air information, provides good estimates of the intrastorm kinematic structure of supercell storms. Spatially derived fields of radial velocity, defined as radial stretching and cross-beam shear, can be used to identify and track major intrastorm kinematic features. These fields can be computed quickly and required neither storm motion information nor a favorable beam-flow alignment. Comparisons between multi-Doppler analyses (and numerical simulation) and the single-Doppler fields show good correlations of the updraft and downdraft zones as well as storm inflow and outflow areas. Changes in surface precipitation rates, from isolated and squall line supercells, are reflected in changes in the intrastorm flow inferred from single-Doppler data. This offers a new technique for single-Doppler radar analyses. In addition, a detailed study of the changes in supercell surface rainfall rates, over a high-resolution raingage network, suggests that a simple linear relationship exists between the maximum point rainfall rate and the areal coverage of threshold rates of 25 mm hr-1 and 55 mm hr-1. Point-area statistical models are presented for individual rain cores, the storm rainfall, and for rainfall over a 4000 km2 watershed. This investigation is the first known detailed study of single-Doppler data and surface rainfall observed over a short time interval. Temporal changes in supercell kinematic structure are related to changes in surface rainfall rates. Supercell rainfall in several different environments are presented. The results suggest that changes in surface rainfall rates are related to changes in intrastorm kinematic flow. Author (GRA)

SYNOPTIC CLIMATOLOGY OF BELL-SHAPED THUNDERSTORMS M.S. Thesis - Oklahoma Univ.

Carlton R. Parks 1981 96 p refs
(AD-A106158; AFIT-CI-81-27T) Avail: NTIS
HC A05/MF A01 CSCL 04/2

Eleven cases of bell-shaped thunderstorm occurrence are analyzed for characteristic features of synoptic patterns, vertical wind shear, and temperature and moisture stratification. Comparisons are made with certain well-documented supercell and multi-cell cases. A model synoptic pattern, sounding, and hodograph are presented. Major findings are: the storms formed in a highly unstable environment just ahead of a dryline, often near a dryline/front intersection. A strong upper-level disturbance was not required to trigger the storms. The storms formed as isolated cells, often to the south of a broker line of existing storms, and often continued as isolated cells for several hours. Except for being slightly more unstable, the environment of the storms did not differ significantly from that of the supercells, but did differ significantly from that of the multi-cell storms. An intense updraft, and the absence of a water-loaded downdraft, may be responsible for many of the physical characteristics of the storms. Author (GRA)

TROPICAL CYCLONE INTENSITY CHANGE: A QUANTITATIVE FORECASTING SCHEME M.S. Thesis - Colorado State Univ.

Kenneth M. Dropco 2 Apr. 1981 95 p refs
(Grant NOAA-NA79-RAD-00002)
(AD-A106157; AFIT-CI-81-30T) Avail: NTIS
HC A05/MF A01 CSCL 04/2

Tropical cyclone intensity change is investigated by comparing tropical cyclone systems which intensify to those which do not. The basis of the intensity change problem was to investigate the effects of baroclinic interaction on the poleward side of cyclone systems. Therefore, cyclones found in the Gulf of Mexico during the period 1957-1977 were examined primarily because of the abundance of data on the north side of these systems. When common meteorological differences could not be found by examination of the weather charts, a rawinsonde comoosite analysis was performed to investigate mean differences between the two systems. The results obtained were significant. Very large differences were found on the northern side of the cyclone particularly in the 200 mb height field, the 850 mb temperature field, the 200 mb zonal wind and the vertical shears of the zonal wind. The individual cyclones which made up the composite study were examined for these same parameters and the results obtained were also significant. GRA

AN OBSERVATIONAL STUDY OF BLOCKING M.S. Thesis

Michael Lindley DSpain 8 Jun. 1981 133 p refs
(AD-A106739; AFIT-CI-81-28T) Avail: NTIS
HC A07/MF A01 CSCL 04/2

The initial purpose of this paper was to use the original concept developed by Hartmann and Ghan (1979) of separating the anomalous ridges solely on the basis of duration and proceed to formulate 3-dimensional pictures from the 1000, 850, 500, and 100 mb pressure levels of the long and short lived ridges, observing any differences which might exist. The three areas of ridge formation studied were defined as the Pacific Ocean (175E-155W), the Pacific Coast (140W-115W), and the Atlantic Ocean (65W-25E). The Pacific regions were characterized by a well developed upstream trough, the ridge itself, and the downstream wavetrains. Both Pacific cases appear consistent with the idea of enhanced production of wave energy due to heating over either the mid-latitude or tropical ocean as suggested by Hoskins and Karoly (1981). The Atlantic cases did not exhibit the same downstream influences as the Pacific cases. The similarity in the height fields over North America between the short and long-lived ridges and the differences in the thermal fields suggests a relationship between the cold temperatures over North America and the long-lived ridges over the Atlantic. A CLIMATOLOGY OF A NEWLY DEFINED TROPOPAUSE USING SIMULTANEOUS OZONE TEMPERATURE PROFILES

Final Report, 1 Jul. 1979 - 1 Jul. 1981

J. M. Roe Hanscom AFB, Mass. AFGL May 1981 109 p refs
(Contract F19628-79-C-0098; AF Proj. 6687)
(AD-A106399; AFGL-TR-81-0190) Avail: NTIS HC A06/MF A01 CSCL 04/2

A physical distinction between stratosphere and troposphere can be made in terms of potential vorticity or ozone. The World Meteorological Organization (WMO) tropopause, based only on thermal stability, does not always separate the different physical properties of the two regions. It is the purpose of this paper to show that the altitude in a vertical ozone profile at which ozone, and therefore potential vorticity, begins to increase rapidly is determinable from the temperature profile alone. The tropopause definition developed here reduces the WMO temperature gradient and thickness criteria and relies on the relative change of temperature lapse rate. The new definition determines heights of the tropopause that are in excellent agreement with ozone profile information. The proposed tropopause definition was applied to an archived ten year global radiosonde data set to prepare a climatology. The definition was also applied to an archived set of several thousand ozonesonde temperature profiles to prepare a climatology of vertical ozone gradient at the tropopause.

IMPLICATION OF SPATIAL AVERAGING IN COMPLEX TERRAIN WIND STUDIES

William Porch 19 Jun. 1981 8 p refs Presented at the AMS Conf. on Mt. Meteorol., Steamboat Springs, Colo., Nov. 1981
(Contract W-7405-eng-48)
(DE81-024451; UCRL-85525-Rev-1; CONF-811104-1) Avail: NTIS HC A02/MF A01

Studies of wind over complex terrain were conducted at two different times at the Geyser's geothermal region of northern California. Optical anemometers with spatial averaging over path lengths of 0.6 to .1 km and conventional cup vane anemometers were utilized. Measurements of spatially averaged wind were used to obtain the average drainaged wind speed component down a small sloping valley with few locations with reasonable instrument exposure accessible to cup anemometers. By comparing the point and spatially averaged wind measurements, it was hoped that data periods could be chosen for numerical wind field model testing when the two measurements were similar.

GUIDE TO BIOLOGICAL WIND PROSPECTING

J. E. Wade and E. W. Hewson Oct. 1981 123 p refs
(Contract DE-AT06-76ET-20316)
(DE82-001425; DOE/ET-20316/80-2) Avail: NTIS HC A06/MF A01

Biological wind prospecting provides techniques for using the natural indicators around us as a guide to the strength, speed, frequency, and direction of the wind. The basis for this wind prospecting is interpretation and study of the shape and distribution of trees, shrubs, insects, and animals, combined with analysis of the impressions of people living in the areas under investigation. The quantitative relationship between mean annual wind speed and three indices of wind effects on trees is shown. Trees can be used successfully to determine mean wind direction, identify the occurrence of severe wind or ice loads, and, most importantly, to estimate mean annual wind speed. DOE

ON THE ANALYSIS OF SEASAT WINDS

Mariano A. Estoque and Jose J. Fernandez-Partagas Apr. 1981 24 p refs
(Grant NA-79-SAC-00737)
(PB81-245649; UM-RSMAS-81001; NOAA-81071407) Avail: NTIS HC A02/MF A01 CSCL 04B

A method for analyzing Seasat-A winds in tropical regions is described which eliminates the ambiguity in the Seasat wind measurement. The ambiguity is eliminated by using wind estimates from low-level cloud motions and synoptic cloud patterns based on satellite pictures, surface wind climatology as well as space-time continuity. In addition, the method takes advantage of certain characteristics of the Seasat wind observations such as the existance of (1) only two solutions at a single point and (2) small angles between solutions. The accuracy of the method has been evaluated by comparing the results of the analysis technique with indepndent observations from ships. GRA

ICE CRYSTAL PROCESSES IN COLORADO, UPSLOPE SNOWSTORMS. ARTICLE 1: CASE STUDY OF AN UPSLOPE SNOWSTORM

H. Riehl and R. F. Reinking Apr. 1981 39 p refs
(PB82-109547; NOAA-81080502) Avail: NTIS HC A03/MF A01 CSCL 04B

The structure and cloud physics characteristics of the lower atmosphere were measured during upslope circulations. Low level air moving westward and upward over the high plains toward the Colorado front range was presumed to induce snowfall or ice deposit on the ground. A cyclonic event occurred in the last week of December, and aircraft missions were flown on 27 December when the storm was at its height east of the mountains. The synoptic system was an upper level cold low advancing at an average speed from southwest into southern Colorado. On the forward side, mesoscale waves appeared to form along the cold front, one of these was crossed by the aircraft. Maximum concentrations of liquid water, turbulence, and shift in thermal advective pattern was found there. GRA

MESOSCALE ASPECTS OF CONVECTIVE STORMS
T. Theodore Fujita Aug. 1981 12 p refs Presented at Nowcasting Symp., Hamburg, 12-28 Aug. 1981 Submitted for publication
(Grants NA80AA-D-00001; NGR-14-001-008; NSF ATM-79-21260)
(PB81-247249; SMRP-RP-191; NOAA-81071408) Avail: NTIS HC A02/MF A01 CSCL 04B

Mesoscale phenomena is studied as it relates to severe local and rain storms. It is concluded that a very accurate combination of radar and satellite measurements hold the key to forecasting the nature of mesoscale clouds, the inducers of severe local storms. Extensive use is made of cloud photographs in analyzing mesoscale phenomena. Examples of severe storm wakes are examined, as are flash flood causing clouds. GRA

WHY WINDSPEEDS INCREASE ON HIGH MOUNTAIN SLOPES AT NIGHT
Robert G. Baughman Jul. 1981 12 p refs
(PB81-243909; FSRP-INT-276) Avail: NTIS HC A02/MF A01 CSCL 02F

The contention that the well documented windspeed increase on high mountain slopes at night is due to the occurrence of a low level jet wind. Various aspects of the meteorological situation most likely to produce these winds are discussed. An example of a low level jet wind that produced strong winds on a ridgetop fire at night is given. WATER TURBIDITY MEASUREMENTS IN GULF SAINT VINCENT
D. M. Phillips, M. L. Scholz, and R. H. Abbot Feb. 1981 28 p refs
(AD-A106274; ERL-0186-TR) Copyright. Avail: Issuing Activity CSCL 08/1

Large scale surveys have been made of the horizontal and vertical distributions of turbidity in the waters of Gulf St. Vincent in South Australia. The beam attenuation coefficient at a wavelength of 530 nm was determined from measurements made with a transmissometer operated from a boat. Both horizontal and vertical stratification of turbidity was observed and explanations for these two conditions are offered. Two methods for determining water turbidity from an aircraft were investigated. They involved measuring the amplitude and attenuation of the backscatter envelope from a laser pulse transmitted from the aircraft into the water. The relative merits of the two methods are evaluated. Author (GRA)

CURRENT MEASUREMENTS OFF KEAHOLE POINT, HAWAII: APPLICATION TO OTEC-1

Volker W. Harms Jun. 1981 11 p refs Presented at the DOE/The Marine Technol. Soc. 8th Ocean Energy Conf., 1981, Washington, D.C., 7-11 Jun. 1981
(Contract W-7405-eng-48)
(DE81-030539; LBL-13208; CONF-810622-9) Avail: NTIS HC A02/MF A01

Detailed current measurements from the OTEC 1 vessel permits a preliminary analysis to be made of current induced hydrodynamic loads on the cold water pipe and hydrodynamic mixing along the trajectory of the mixed sea water plume. The measured equilibrium depth of the plume agrees well with that predicted by the plume model and occurs near the base of the ocean mixed layer. Ocean turbulence is found to provide some mixing. Several possible causes for excessive hydrodynamic loading on the cold water pipe are enumerated. DOE

PROCEEDINGS OF THE GULF CIRCULATION STUDIES WORKSHOP Final Report

May 1981 96 p Workshop Held at New Orleans, 14-15 May 1981 Prepared in cooperation with Tetra Tech., Inc., Melville, N.Y.
(Contract DI-AA851-CTO-72)
(PB81-248254; BLM-YM-P/T-81-005-3331) Avail: NTIS HC A05/MF A01 CSCL 08C

On-going and prospective energy-related uses support continued research on the physical processes governing Gulf of Mexico circulation. A circulation modeling effort for the southwest Florida shelf, and a circulation model of the entire Gulf system are described. A three-year research program to obtain physical oceanographic data in the Gulf is discussed. Because the Gulf loop current is the dominating circulation feature, a primary goal of this measurement program is to improve our understanding of the driving forces of the loop current, and the loop current's interaction with general Gulf-wide circulation. NORTHERN GULF OF MEXICO TOPOGRAPHIC FEATURES STUDY, EXECUTIVE SUMMARY Summary Report

Mar. 1981 140 p refs 6 Vol.
(Contract DI-AA550-CT8-35)
(PB81-248643; TR-81-2-T) Avail: NTIS HC A07/MF A01; also available in set of 6 reports HC E99 as PB81-248635 CSCL 08J

This study characterizes selected topographic features in the Gulf of Mexico. Mapping, subbottom profiling, and descriptive reconnaissance studies were completed for the Florida Middle Ground and Alderdice, Coffee Lump, Diaphus, Elvers, Fishnet, Geyer, Jakkula, and Rezak-Sidney Banks. These studies assess the geology and biology of the banks as observed from the submersible DRV DIAPHUS. The report also provides information on four previously studied. Applebaum (previously called Little Sister), 32 Fathom, and the East and West Flower Garden Banks. The East Flower Garden monitoring study was continued, an identical monitoring program was instituted at the West Flower Garden, and maps of the West Flower Garden were prepared. Chemical analysis of sediments for trace metals, high molecular weight hydrocarbons, Delta C-13, and total organic carbon was conducted for Coffee Lump and the East and West Flower Garden Banks. Other studies at the Flower Garden Banks include analysis of 'Spondylus' and certain fish species for trace metals and high molecular weight hydrocarbons, and analysis of water samples for nutrients and dissolved oxygen. GRA

This chapter provides an integrated multidisciplinary overview of the Florida Middle Ground. The overview is designed to integrate complete geophysical mapping with site specific submarine ground truthing, geological sampling, physical oceanographic, in situ, and time series recording, and biological and chemical sampling. The geophysical, physical, and geological data are used to describe the setting for biological data. The collection of biological data itself was designed around management concepts to address two diverse management objectives. GRA

AN INTRODUCTION TO SEA STATE FORECASTING
Graham P. Britton (Royal Navy) and Kenneth E. Lilly, Jr., ed.
1980 229 p refs
(Contract DOC-7-35218)
(PB81-242687) Avail: NTIS HC A11/MF A01; HC Avail: SOD CSCL 08C

The forecasting of sea states is shown to be dependent upon an analysis of the relationships existing between the atmosphere and the ocean. Observation and measurement of the sea and swells, and the structure of the atmosphere overlying the sea surface are discussed. The effects of variations in air and water density on sea and swell generation are examined as well as the dynamics of the atmospheric boundary layer and the effect of fronts. The use of wave spectra data in marine synoptic analysis, the monitoring of cold air outbreaks, and the theoretical treatment of waves are discussed. GRA

VARIATION IN PLANT RESPONSE TO OZONE: A CONCEPTUAL MODEL OF PHYSIOLOGICAL EVENTS
D. T. Tingey and G. E. Taylor, Jr. 1980 47 p refs Presented at 32nd Symp. on Effects of Gaseous Air Pollution in Agr. and Hort., Nottingham, England, 1 Sep. 1980 Prepared in cooperation with Oak Ridge National Lab.
(Contract W-7405-eng-26)
(DE81-029692; CONF-8009172-1) Avail: NTIS
HC A03/MF A01

The environment and genotype exert profound influences on a plant's ozone response. Based on the multiplicity of physiological mechanisms responsible for variable response, a common progression of events is proposed: ozone conductance (gas and liquid phase), perturbation, homeostasis, and injury. Injury is the repercussion of the preceeding events. Gas and liquid phase conductances are significant sources of variable ozone response. Genic expression and environmental stimuli affect ozone conductance and homeostasis and thereby the extent of injury. Based on conceptual model, gas phase conductance would be the decisive factor controlling injury only if it were the rate limiting step. Any physiologically significant intervening event between gas-phase conductance and injury would reduce the association between them. Either liquid phase conductance of homeostasis could reduce that association. DOE

MICROBIOLOGICALLY-MEDIATED MUTAGENIC ACTIVITY OF CRUDE OIL Final Report, 1976 - 1979
Bruce A. Cummings and Ronald C. Gordon Sep. 1981 302 p refs
(Grant EPA-R-805041)
(PB82-105131; EPA-600/3-81-053) Avail: NTIS
HC A14/MF A01 CSCL 06T

Crude oil was incubated with raw and sterile river water samples and assayed for mutagenic activity for the Ames test to determine the ability of naturally occurring freshwater microorganisms to form mutagenic biodegradation products from crude oil. River water samples supplements with inorganic salts were incubated with one percent crude oil in Erlenmeyer flasks for 1-6 weeks and 4 and 20 C with shaking. Replicate flasks were extracted at various time intervals with 1,1-2 trichloro-1,2,2-trifluoroethane, the solvent evaporated and the residues taken up in dimethyl sulfoxide for mutagenicity testing. The extracts were assayed for mutagenic activity by the plate incorporation method of the Ames test with Salmonella tester strains TA 100, TA 1535, TA 1537, TA 1538 and TA 98. Mammalian liver microsomes were not used in the mutagenicity test system as the oil degrading microorganisms constituted the enzyme activation system in the study. GRA

MECHANISMS OF CADMIUM ABSORPTION IN RATS

Ernest. C. Foulkes, D. R. Johnson, Naoki Sugawara, Roland F. Bonewitz, and Cathleen Voner Sep. 1981 59 p refs
(Grant EPA-R-805840)
(PB82-108184; EPA-600/1-81-063) Avail: NTIS HC A04/MF A01 CSCL 06T

The study was undertaken in order to help clarify the factors which determine the fractional absorption of an oral load of cadmium (Cd) from the intestine of the rat. The experiments utilized intact segments of intestine, perfused or incubated in situ, with their blood supply intact. Absorption of Cd from the jejunal lumen can be ascribed to a saturable membrane system, that is after short periods of exposure essentially all the metal removed from the lumen was recovered in mucosal issue (Step 1). The second step in Cd absorption, i.e., transfer of the metal from mucosa into blood, proceeded at only 1-2% of the rate of uptake from the lumen (Step 1). No evidence was obtained for a role of metal lothionein in the mucosal retention of Cd. Step 1 of Cd absorption was inhibited by a variety of exogenous and endogenous factors. Thus, zinc was found to depress Cd transport in an apparently competitive manner. Addition of milk to the lumen also inhibited Cd uptake, an effect entirely due to the Ca content. Bile salts act as endogenous modulators of Cd absorption; their effect may be related to micelle formation. The research also included studies of duodenal and ileal Cd transport. GRA

SYSTEMIC AND CEREBRAL HEMODYNAMICS IN FLIGHT PERSONNEL EXPOSED TO MODERATE HYPOXIA c52

V. N. Denisov, S. F. Rayev, and I. I. Antufyev *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 19-23 Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 16-19 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

For the purposes of medical expertise the state of systemic and cerebral hemodynamics was investigated in 66 pilots with autonomic-vascular instability and in 36 healthy subjects exposed to moderate hypoxia (in an altitude chamber). The pilots showed noticeable tachycardia or systolic hypertension, as well as certain changes in cardiac output and stroke volume. These alterations were accompanied by rheoencephalographic changes of two types one of which can be regarded as an adverse response of cerebral circulation to hypoxia. It is concluded that the study of systemic and cerebral circulation in hypoxia yields important diagnostic information that allows better estimates. M.G.

CAUSES OF FATIGUE AMONG CREWS OF CIVIL AVIATION HELICOPTERS c52

Yu. N. Kamenskiy *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 24-27 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 19-22 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The role of vibration and noise in the development of fatigue in helicopter crews was assessed. The exposure to these factors during the flying shift results in an early and marked fatigue of pilots the level of which depends on the vibration effects to a larger extent than on the noise effects. The fatigue is followed by a decline of the psychophysiological parameters characterizing the visual and motor functions as well as the ratio of the basic processes in the central nervous system. PHYSIOLOGICAL AND HYGIENIC EVALUATION OF VIBRATION IN THE COCKPIT OF A CARGO HELICOPTER c54

Yu. G. Matveyev and Yu. N. Kamenskiy *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 28-32 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 22-25 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The correlations between statistical parameters of vibration in the work place, work schedules, and functional state of subjects when performing commercial flights were studied. In the cockpit of five helicopters the floor and the chair vibrated in a band of 8 Hz at a frequency of 112.5 and 114.0 dB, respectively. Before and after the flying shift 66 crewmembers were interviewed and examined. Vibration was referred to as the most unpleasant factor by 30.4% of them, noise was defined as the most unpleasant factor by 6.5% of them; 63.1% described both factors as similarly adverse. The level of psychophysiological changes was proportional to the flight time. The first signs of fatigue were seen after flights of up to 5 hours in duration, to increase drastically after flights of 6 and 7 hours. M.G.

EVALUATION OF MAN'S ENDURANCE OF LOCAL PRESSURE TO THE HEAD AND OBJECTIVE ASSESSMENT OF HYGIENIC SPECIFICATIONS FOR PROTECTIVE HELMETS c52

V. M. Sinigin, Yu. G. Konakhevich, L. N. Sholpo, and A. I. Uglanov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 33-37 Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 25-28 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

To obtain reference data for a statistically substantiated evaluation of man's tolerance to the local pressure on the head (as applied to protective helmets kept on for a long time), 86 experiments were carried out in which 11 test subjects participated. The local pressure of 0.05 to 0.5 kg/sq cm was applied to eight areas of the head. The tolerance time was measured as the time interval from the beginning of the exposure to the emergence of localized sensations of the type: unpleasant, painful, very painful, or intolerable. As a result, statistically significant relationships between the tolerance time and the level of the local pressure were obtained for the eight locations and four grades of subjective sensations. These data can be used in evaluating protective helmets to be worn for a long time as well as in developing hygienic requirements for the advanced helmet-like devices. Author

EFFECT OF TRANSMERIDIONAL FLIGHTS ON BIORHYTHM OF ZONE FORMATION BY STREPTOMYCES LEVORIS c52

A. P. Savelyev, A. Kh. Akhmadiyeva, and I. G. Akoyev *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 38-41 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 28-31 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The transmeridioneal transportation of the temperature controlled colonies of Streptomyces levoris exerted a marked effect on its biorhythms. This included changes in the growth and zone formation rates and differences in the vector of changes as related to the flight direction. The vector of changes during an east-oriented airborne flight coincided with that in orbital flight with a similar direction of transportation. These findings as well as the results of studies of seasonal and diurnal rhythms of the actinomycete zone formation suggest the synchronizing effect of the periodicity of geophysical factors. M.G.

SIMULATION OF SOME OF MAN'S MOVEMENTS IN DIFFERENT GRAVITY FIELDS c54

A. V. Zinkovskiy, I. A. Trofimova, and V. A. Chistyakov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 42-45 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 31-33 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The control of man's movements during adaptation to an altered gravity field was modeled by mathematical methods. Two types of movements were investigated: forearm displacement with various loads and repulsions from a support in zero-G and at high G's. It was shown that movement coordination in altered gravity fields can be maintained due to a rearrangement of the control over muscle contraction which includes changes in the amplitude and pattern of joint momenta in harmony with the gravity changes. CATHEPSIN ACTIVITY OF SKELETAL MUSCLE AND MYOCARDIA MYOFIBRILS AFTER EXPOSURE TO WEIGHTLESSNESS AND ACCELERATIONS

S. S. Oganesyan and M. A. Eloyan *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 54-59 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 38-42 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The rats flown onboard Cosmos-605 and exposed to a synchronous experiment for 22 days showed an increased activity of myofibrillar cathepsins in skeletal muscles of different groups. In the flight rats the increase was greater than in the synchronous ground-based animals. This suggests a significant effect of weightlessness on the cathepsic activity. The parameter was partially normalized at R+ 25 or 26 days. The exposure of rats to accelerations of 4 and 5 G for 2 min daily during 2 weeks also increased the cathepsic activity of skeletal and myocardial myofibers. The parameter returned to normal a month after completion of acceleration exposures. Thus, changes in the proteolytic activity of myofibers of different muscles induced by weightlessness and acceleration are reversible. The significance of changes in the muscle tension as related to the mechanism of stimulation of proteolytic reactions is discussed. M.G.

CYTOKINETIC EVALUATION OF ERYTHROPOIESIS DURING LONG-TERM ORBITAL FLIGHTS c52

A. V. Ilyukhin and T. Ye. Vurkovskaya *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 60-64 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 42-46 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The mechanisms of erythropoietic changes at the cellular level during a prolonged exposure to weightlessness were investigated. Following 96-, 140- and 175-day space flights cytokinetic and morphological changes in erythropoiesis were observed. The count of circulating erythrocytes decreased inflight and their life time reduced postflight. The shortening of the life time of erythrocytes postflight was paralleled by increased proliferative activity of erythroid cells. The erythrocytic balance was not reached as late as R+36 days. B.W.

NOREPINEPHRINE AND ENZYMES OF SYNTHESIS AND DEGRADATION THEREOF IN THE RAT HYPOTHALAMUS FOLLOWING FLIGHT ABOARD THE COSMOS-936 BIOSATELLITE

T. Torda, R. Kvetnyanski, R. A. Tigranyan, Yu. Chulman, and A. M. Genin *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 65-68 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 46-48 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

In the hypothalamus of weightless and centrifuged rats flown for 18.5 days onboard the biosatellite Cosmos-936, the noradrenaline concentration and activity of the enzymes involved in the catecholamine synthesis and degradation were measured. It was found that under the space flight influence the noradrenaline concentration and tyrosine hydroxylase, dopamine-beta-hydroxylase, and monoamine oxidase activities remained unaltered. These findings indicate that a prolonged exposure to weightlessness was not a stressogenic agent that could activate the adrenergic system in the rat hypothalamus. B.W.

TOXICOLOGICAL AND HYGIENIC ASPECTS OF IMPROVING ADDITIONAL PURIFICATION OF WATER RECLAIMED FROM URINE c54

Z. P. Pak, G. V. Lobacheva, M. M. Spiryayeva, Yu. Ye. Bezumova, T. P. Korotkova, V. P. Petina, and Ye. S. Yevdokimova *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 73-78 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 51-54 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

Comparative toxicological and hygienic studies of samples of reclaimed water obtained from urine with the use of different final purification variants were conducted. The sorption-catalytic method of urine condensate repurification using a platinum-carbon catalyst proved to be the most promising since it can ensure the production of toxicologically safe potable water. It was shown experimentally that the quality of reclaimed water as related to its chemical and toxicological parameters depends on the efficiency of the repurification unit. B.W.

DISTINCTIONS OF REGENERATION OF CONFINED ATMOSPHERE BY MEANS OF PHOTOSYNTHESIS OF UNICELLULAR ALGAE c54

G. I. Meleshko, L. M. Krasotchenko, and Ye. K. Lebedeva *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 84-90 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 58-62 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

Systems of biological air regeneration using photosynthesis of unicellular algae are examined. An oxygen-carbon dioxide mismatch associated with the difference in gas exchange coefficients of man and algae is shown. The value and vector of the mismatch depend on the degree of the above difference. In the system balanced with respect to oxygen consumption and carbon dioxide production, the rate of the mismatch equals to 1 per cent of either process per each unit of the difference of the gas exchange coefficients in the second decimal point. Methods for regulating the algal assimilation coefficient based on the use of various nitrogen forms for algal nutrition and controlled biosynthesis are discussed. Optimal variants of gas exchange balance in the semi-closed biological life support systems are described. B.W.

LIPID SPECTRUM OF THE MYOCARDIUM OF WHITE RATS EXPOSED TO HYPOXIC HYPOXIA

S. A. Sergeyev and G. A. Gribanov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 104-108 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 71-74 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

By a modified microthin-layer chromatography the total lipid spectrum of the cardiac muscle of white rats exposed to acute oxygen deficiency in an altitude chamber was investigated. It was found that the content of total lipids, phospholipids, free cholesterol, free fatty acids and triglycerides decreased during acute hypoxia. The exposure induced changes in the amount of glycerophosphatids, phosphatid acids and polyglycerophosphatids whose content diminished significantly. The concentration of phosphatidyl serines and phosphatidyl ethanol amines lowered to a lesser extent while that of sphyngomyelins increased. Acute oxygen deficiency accelerates the release of inorganic phosphate from the heart, thus, together with other factors, leading to disorders in the heart energetics. These findings indicate an important role of hypoxic hypoxia in the disturbances of lipid metabolism of the myocardium. This needs to be taken into consideration in the diagnostics and treatment of such states. Author

CLINICAL DISTINCTIONS OF RADIATION SICKNESS WITH EXPOSURE OF DIFFERENT PARTS OF THE HUMAN BODY TO RADIATION c52

G. F. Nevskaya, G. M. Abramova, M. A. Volkova, Ye. V. Kavlycheva, A. S. Skorik, and V. V. Yurogov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 113-118 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 77-80 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

The clinical picture of radiation sickness of 139 radiological patients exposed to local irradition of the head, chest, and stomach with efficient doses of 210 rad was examined. It was found that at fractionated local irraditions the clinical symptom-complex of radiation sickness was identifical to that seen as a result of total-body irradiation. During head irradiation the major symptom was headache and during stomach irradiation nausea. The severity level of radiation damage measured with respect to the clinical symptom-complex as a whole with the aid of the bioinformation model was similar during irradiations of the head and stomach, much higher during irradiation of the chest. During head and stomach irradiations the severity level of radiation damage was proportional to the efficient dose. During chest irradiation there was no correlation between the severity level and the exposure to doses of 210 rad. Author

METHOD OF RECORDING ROTATORY EYE REFLEXES c52

M. M. Levashov and A. V. Dmitriyev *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 119-122 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec 1981 p 80-82 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

A method of recording rotatory eye reflexes in real time using polarized light is described. When a beam of light going to the photodetector is passed successively through two polarizers, illumination of the detector will depend on reciprocal orientation of polarization planes. Reciprocal rotation of polarization planes alters illumination proportionally to the cosine of angle of rotation. When the planes are parallel (0 degree angle), illumination is at a maximum, and when one of the planes is rotated 90 degrees in relation to the other, it is minimal. A miniature photoresistor is used as a detector, and it is covered with polarizing layer. The detector is placed on the anesthetized eyeball with suction cups. The light source and miniaturized amplifier unit were assembled on a mask worn over the subject's head. R.J.F.

ELECTRODE UNIT FOR TESTING HUMAN H REFLEX c52

V. I. Zborovskaya and E. A. Skiba *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 123-124 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 82-83 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

Use of a method of recording H reflexes that makes it possible to test the level of reflex activity of spinal motoneurons at rest and during movement, as well as to make qualitative and quantitative evaluations of various supraspinal and afferent factors is discussed. An electrode unit for electrostimulation of peripheral nerves or muscles was made. It has 6 electrodes 8-10 mm in diameter, which are mounted on an elastic dielectric plate. Rounded corners of the plate protect the skin from trauma when the electrode unit is secured firmly. The electrode unit is secured firmly to the region of the popliteal fossa, connected to the electrosimulator through a selector which connects the unit electrodes one after the other. The stimulation point is determined from the nature and magnitude of responses elicited in the muscle innervated by the stimulated nerve. R.J.F.

COMPARATIVE ANTIHYPOXIC EFFICACY OF PRESSURE CHAMBER CONDITIONING AND FASTING OF MAN c52

A. Yu. Katkov, Ye. A. Kovalenko, R. N. Chabdarova, G. A. Davydov, S. A. Vtoryy, and N. M. Utkina *In its* USSR Rept: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec. 1981 (JPRS-79849) 12 Jan. 1982 p 125-128 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 84-86 (For primary document see N82-16704 07-51)

Avail: NTIS HC A08/MF A01

Two theoretically possible means of enhancing man's resistance to rapidly increasing hypoxia, pressure chamber conditioning and fasting, are studied. Eleven essentially healthy men were divided into two groups. The first group of subjects was submitted to 10-day pulsed pressure chamber conditioning. The second group of subjects spent 14 days on a total fast, without limiting water intake. Endurance of hypoxia in the first group was determined before pressure chamber conditioning and immediately after it, and in the second group before the fast and on the 14th day of food deprivation. The subject was raised continuously in the chamber at the rate of 20 m/s at rest, to maximum tolerance of altitude. The subject was raised again at the same speed 30 minutes after descending to 'Earth', but with concurrent performance of exercise on a bicycle ergometer constituting 200 kg-m/minutes. In both cases, the subject had to report the current 'altitude when so instructed. In the course of the test, a continuous recording of oxygen tension in the skin of the left forearm was made by the polarographic method. At normal barometric pressure, body weight, gas exchange, morphological and gas composition, and acid-base equilibrium of capillary blood was determined. R.J.F.

CONDITION OF MENINGEAL NERVOUS SYSTEM DURING REPEATED EXPOSURE TO TRANSVERSE ACCELERATIONS c52

G. A. Konstantinovskiy *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 15, No. 6, Nov. - Dec 1981 (JPRS-79849) 12 Jan. 1982 p 129-132 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 15, no. 6, Nov. - Dec. 1981 p 86-88 (For primary document see N82-16704 07-51)
Avail: NTIS HC A08/MF A01

The nerve elements of the dura and pia mater of the brain of 19 puberal cats weighing 2 to 3 kg were examined following repeated exposure to transverse accelerations (chest-back) for 20 minutes at 24-hour intervals, for 6 days. A force of 8 units with a gradient of acceleration build-up and decline of 0.5 to 0.4 unit/s was generated on a centrifuge with a 5 m arm, equipped with specially molded containers, in which the animals were immobilized in their physiological position. The cats were sacrificed using ether fumes at different times after the experiments: 1, 3, 7, 30 and 90 days, which enabled experimentors to track the dynamics of recovery processes. The meninges of five intact animals of the same ages and weight served as a control. Nervous elements were demonstrated by means of silver nitrate impregnation according to Bielschowsky, in various modifications, followed by gold-plating and additional staining with nuclear-plasma stains. R.J.F.

52 AEROSPACE MEDICINE

Includes physiological factors, biological effects of radiation; and weightlessness.

DETECTION OF AMBLYOPIA UTILIZING GENERATED RETINAL REFLEXES Final Report

J. H. Kerr and S. H. Hay 13 Nov. 1981 52 p refs
(Contract NAS8-33819)
(NASA-CR-161944; Rept-5153-33819) Avail: NTIS HC A04/MF A01 CSCL 06E

Investigation confirmed that GRR images can be consistently obtained and that these images contain information required to detect the optical inequality of one eye compared to the fellow eye. Digital analyses, electro-optical analyses, and trained observers were used to evaluate the GRR images. Two and three dimensional plots were made from the digital analyses results. These plots data greatly enhanced the GRR image content, and it was possible for nontrained observers to correctly identify normal vs abnormal ocular status by viewing the plots. Based upon the criteria of detecting equality or inequality of ocular status of a person's eyes, the trained observer correctly identified the ocular status of 90% of the 232 persons who participated in this program. FATIGUE IN FLIGHT INSPECTION FIELD OFFICE (FIFO) FLIGHT CREWS

C. E. Melton, J. M. McKenzie, S. M. Wicks, and J. T. Saldivar Apr. 1981 51 p refs
(AD-A106791; FAA-AM-81-13) Avail: NTIS HC A04/MF A01 CSCL 06/19

Studies related to FIFO aircrew stress and fatigue were carried out at seven FIFO's in the Continental U.S. Forty-one men served as subjects and all crew positions were presented. Each crewmember was studied during flight activities and during office based activities. Generally, crews were in travel status during flight inspection activities and away from the office for 5 d. Crewmembers completed fatigue checklists before and after each duty on every workday. Urine specimens were collected that represented the night sleep period and the work period; they were analyzed for 17 ketogenic steroids, epinephrine, and norepinephrine, and values were expressed as weight per hundred milligrams of urinary creatinine. Ambulatory electrocardiograms were recorded for determination of heart rate (HR) during work. The data indicate that office work is distinctly less fatiguing than flight work. This finding is supported by the HR data that indicate a lower workload in the office than in flight. The statement is commonly made by crewmembers that office work is more fatiguing than flight work. It is probable that such statements are based on work preference rather than work level. Some crewmembers at Oklahoma City, Atlanta, Los Angeles, and Battle Creek show severe fatigue associated with flight work. GRA

ACCELERATION MEASURES AND MOTION SICKNESS INCIDENCE

Carl A. Mauro and Dennis E. Smith Nov. 1981 24 p refs Presented at the Intern. Workshop on Res. Methods in Human Motion and Vibration Studies, New Orleans 16-18 Sep. 1981
(Contract N00014-79-C-0128; NR Proj. 207-037)
(AD-A107996; TR-112-10) Avail: NTIS HC A02/MF A01 CSCL 06/19

An important aspect of motion sickness research is to establish quantitative relationships between sickness incidence and various parameters of the motions that induce sickness. At present, however, only wholebody vertical sinusoidal motion has been studied to any reasonable degree. The purpose of this report is to examine the predictive utility of six different characterizations of sinusoidal motion and to investigate their possible extension to dual frequency motion. CHEMICALS IDENTIFIED IN HUMAN BIOLOGICAL MEDIA

M. Virginia Cone and Cindy Stroup (EPA) 1981 6 p refs Presented at 2nd EPA/NCI Ann. Collaborative Workshop Environ. and Occupational Cancer Studies, Rockville, Md., 9-11 Sep. 1981
(Contract W-7405-eng-26)
(DE81-030813; CONF-810959-1) Avail: NTIS HC A02/MF A01

Sources of data are from the world literature, retrospective to 1974. Information from approximately 1500 documents is in the data base at the present time. The data base contains information on 750 chemicals. Approximately 10% of the total documents in the file concerned pesticides; 30% drugs; and 40% metals. The remaining 20% were about other substances, including industrial chemicals and organics which are of interest to NCI and EPA. T.M.

REVIEW OF LITERATURE AND REGULATION RELATING TO THORACIC IMPACT TOLERANCE AND INJURY CRITERIA Final Report, Jul. 1980 - Jun. 1981

Robert L. Hess, Kathleen Weber, and John W. Melvin Jul. 1981 281 p refs Sponsored in part by Motor Vehicle Manufacturers Association
(PB82-108697; UM-HSRI-81-38) Avail: NTIS HC A13/MF A01 CSCL 06S

The technical and scientific literature dealing with thoracic injury to or within the rib cage, from blunt loading is reviewed. The history of the development of associated Federal Motor Vehicle Safety Standards is reviewed from the aspect of its relationship to the history of development of the research information. Field case data from car-to-car and car-to-tree/pole crashes has been examined and summarized. This study suggests that the laboratory research has not adequately covered the principal variables found to exist in actual injury cases. Specifically more research attention should be given to the shape of the impactor, to the loading location and directory, and to injuries in the contusion and/or laceration family. Correspondingly, the accident investigation process needs to be more sensitive to occupant/vehicle interior interaction variables so that laboratory research can be properly guided. GRA

IN VIVO RECORDING OF BLOOD VELOCITY PROFILES AND STUDIES IN VITRO OF PROFILE ALTERATIONS INDUCED BY KNOWN STENOSES
M. Bassini, E. Gatti (Politecnico di Milano), T. Longo (Milan Univ.), G. M. Martinis, P. Pignoli (Milan Univ.), and P. L. Pizzolati 1980 36 p refs Presented at the 4th Intern. Conf. of the Cardiovascular System Dyn. Soc. Peripheral Vascular Hemodyn.: Basic and Clinical Aspects, Miami, Fla., 12-15 Nov. 1980
(PB81-244139; CISE-1655) Avail: NTIS HC A03/MF A01 CSCL 06B

Measurements were obtained with a pulsed ultrasonic instrument based on the analysis of the cross-correlation function of blood diffused echoes. The alterations and velocity in the time domain were studied in vitro as function of the distance between stenosis and measuring point, and position of the sample volume along the diameter. These studies may be useful for a better comprehension of blood velocity measurements made with ultrasound equipments for clinical non-invasive diagnostic purposes. T.M.

CHOOSING AMONG ALTERNATIVES WITH UNCERTAIN OUTCOMES: EFFECT OF PRIOR CURING AND ESTIMATION REQUIREMENTS
Shanta P. Kerkar and William C. Howell Aug. 1981 45 p refs
(Contract N00014-78-C-0555; NR Proj. 197-050)
(AD-A106143; TR-81-2) Avail: NTIS HC A03/MF A01 CSCL 05/1

Previous investigations by the authors have shown that judgments of frequency or probability have a facilitatory influence on subsequent predictive choice performance. The present study examined both these judgement processes more closely in an attempt to understand how they affect choices. Five groups of subjects served as emergency vehicle dispatchers for a hypothetical city. The experimental design involved a 2 x 2 factorial combination of response set and estimation task. More specifically, response set, defined as expectation of a frequency or probability response requirement, was crossed with actual response requirement, either frequency or probability estimation, in a between-groups design.

AN ANALYSIS OF COGNITIVE MAPPING SKILL Interim Report
Perry W. Thorndyke and Sarah E. Goldin Mar. 1981 66 p refs
(Contract MDA903-79-C-0549)
(AD-A106145; RAND/N-1664-ARMY) Avail: NTIS HC A04/MF A01 CSCL 08/2

Compares the performance of good and poor cognitive mappers on a variety of spatial knowledge acquisition and judgment tasks. Cognitive mapping skill was assessed by measuring subjects' knowledge of a highly overlearned environment, their home community. Subjects categorized as good or poor cognitive mappers participated in a series of experiments that examined learning a novel environment from navigation experience, map learning, map using and map interpretation, spatial judgments based on a memorized map, and navigation in a novel environment based on a memorized map. Good mappers performed more accurately than poor mappers in learning a novel environment, learning maps, and making spatial judgments based on a memorized map. Map using, map interpretation, and navigation tasks did not distinguish good from poor mappers. We conclude that, relative to poor mappers, good cognitive mappers are better able to encode and retain spatial information in memory and to mentally transform or manipulate spatial information in order to make spatial judgements, and we hypothesize that differences in spatial visualization and visual memory abilities may underlie these variations in task performance.

ABILITY DIFFERENCES AND COGNITIVE MAPPING SKILL Interim Report
Perry W. Thorndyke and Sarah E. Goldin Mar. 1981 66 p refs
(Contract MDA903-79-C-0549)
(AD-A106389; RAND/N-1667-Army) Avail: NTIS HC A04/MF A01 CSCL 08/2

Compares good and poor cognitive mappers on a number of individual difference variables potentially related to cognitive mapping skill: spatial abilities, visual/verbal processing style, motivation, and experience. Good and poor mapper groups were given several assessment tests for each of these categories. Comparisons of good and poor mappers' performance on these tests indicated that only spatial abilities reliably distinguished good mappers from poor mappers. Good cognitive mappers showed greater visualization ability, spatial orientation ability, visual memory, and field independence. Other measures showed no between-group differences. It is concluded that spatial ability is a major determinant of cognitive mapping skill and that spatial ability tests can be used to select personnel for tasks requiring navigation, orientation, and spatial judgment skills Author (GRA)

STORAGE STABILITY AND IMPROVEMENT OF INTERMEDIATE MOISTURE FOODS, PHASE 5 Final Report, 1 Oct. 1976 - 28 Feb. 1978
Theodore P. Labuza 28 Feb. 1978 399 p refs
(Contract NAS9-12560)
(NASA-CR-167503) Avail: NTIS HC A17/MF A01 CSCL 06H

A method for measuring water binding (a sub w) in gels which was developed and applied to various macromolecular geling agents in order to elucidate their mechanism of water binding was confirmed with concurrent studies using NMR, X-ray diffraction and dye diffusion. The vapor pressure manometric method for a sub w was further refined to give a sub w to + or - 0.0001 units, and a new fiber cup procedure was tested against it. The effectiveness of low a sub w on inhibiting potential toxin production by S. aureus was demonstrated. In addition, ethanol, was shown to be an effective antimicrobial agent at low concentration in lowered a sub w systems. The results of a study of vitamin C loss during processing at high temperature (60-150C) show a change to zero order kinetics due to poor oxygen solubility. Steady state temperature data can be used to predict losses during unsteady state processing. Non-enzymatic browning can be reduced at higher process temperature if residence time decreases. A shelf stable IMF processed cheese food was developed and shown to be acceptable in storage.

A HYDRODYNAMIC MODEL OF AN OUTER HAIR CELL
Bo O. Jacobson 1982 14 p refs To be presented at the 19th Ann. Northeast Bioengr. Conf., Hanover, New Hampshire, 15-16 Mar. 1982; sponsored by the Thayer School of Engineering Dartmouth Med. School, IEEE, ASME, and the American Society for Engineering Education
(NASA-TM-82773; E-1098) Avail: NTIS HC A02/MF A01 CSCL 06P

On the model it is possible to measure the force and the force direction for each individual hair as a function of the flow direction and velocity. Measurements were made at the man flow velocity .01 m/s, which is equivalent to a flow velocity in the real ear of about 1 micrometer/s. The kinematic viscosity of the liquid used in the model was 10,000 times higher than the viscosity of perilymph to attain hydrodynamic equality. Two different geometries for the sterocilia pattern were tested. First the force distribution for a W-shaped sterocilia pattern was recorded. This is the sterocilia pattern found in all real ears. It is found that the forces acting on the hairs are very regular and perpendicular to the legs of the W when the flow is directed from the outside of the W. When the flow is reversed, the forces are not reversed, but are much more irregular. This can eventually explain the half wave rectification of the nerve signals. As a second experiment, the force distribution for a V-shaped sterocilia pattern was recorded. Here the forces were irregular both when the flow was directed into the V and when it was directed against the edge of the V. T.M.

THE EFFECTS OF MICROPHONES AND FACEMASKS ON LPC VOCODER PERFORMANCE
Elliot Singer 25 Sep. 1981 26 p refs
(Contract F19628-80-C-0002; AF Proj. 2283)
(AD-A107908; TR-584; ESD-TR-81-277) Avail: NTIS HC A03/MF A01 CSCL 05/8

The effects of oxygen facemasks and noise cancelling microphones on LPC vocoder performance were analyzed and evaluated. Likely sources of potential vocoder performance degradation included the non-ideal frequency response characteristics of the microphone, the acoustic alterations of the speech waveform due to the addition of the facemask cavity, and the presence of breath noise imposed by the close-talking requirement. It is shown that the presence of the facemask produces a vowel-dependent reduction in the bandwidths of the upper speech formants. In addition, the low frequency emphasis normally associated with small enclosures is shown to occur when a pressure microphone is employed for transduction. Noise cancelling microphones, which are sensitive to the pressure gradient, do not exhibit this effect. Finally, an acoustic tube model of the vocal tract and facemask is presented which predicts the absence of spurious resonances within the frequency band of typical narrowband vocoders. Evidence supporting these assertions is presented based on observed vowel spectra. Evaluations performed using Diagnostic Rhyme Tests indicate that the presence of the oxygen facemask and noise cancelling microphone does not result in a significant increase in the LPC vocoder processing loss. PILOT WORKLOAD: A SURVEY OF OPERATIONAL PROBLEMS Final Technical Report, Apr. 1979 - Sep. 1980
Larry Butterbaugh, Debra Warner, Peter Lovering, and Sam Herron
Wright-Patterson AFB AFWAL Aug. 1981 186 p refs
(Contract F33615-78-C-3614; AF Proj. 2403)
(AD-A107758; AFWAL-TR-81-3011) Avail: NTIS HC 09/MF A01 CSCL 01/3

Five hundred and seventy three USAF pilots responded to a survey which had as its objective the identification of operational, crew station design related causes of high pilot workloads. The survey consisted of mailed survey forms and personal interviews structured to conform with the critical incident technique of collecting user-provided data. The survey canvassed over 50 USAF organizations in collecting data for more than 30 currently flown USAF aircraft types. The role control/display design, crew station design, and equipment malfunctions play in contributing to cockpit workload is unique to each aircraft. Other factors, such as weather, flight schedules, and mission phase appear to contribute to cockpit workloads in most all the aircraft surveyed. Further, the reported situations, or critical incidents, indicate that high workloads result from the simultaneous occurrence or existence of several causes. For example, a high workload situation reported for the FB-111 consisted of an equipment failure while flying the low level penetration portion of a mission at night. All data collected has been catalogued for the establishment of an information base, and available for future use in conjunction with aircraft development programs or modernization/retrofit programs Author (GRA)

PRODUCTS OF MULTIPLE FOURIER SERIES WITH APPLICATION TO THE MULTIBLADE TRANSFORMATION

Donald L. Kunz Dec. 1981 20 p refs Prepared in cooperation with Army Aviation Research and Development Command, St. Louis
(NASA-TM-81340; A-8796; USAAVRADCOM-TR-81-A-28)
Avail: NTIS HC A02/MF A01 CSCL 12A

A relatively simple and systematic method for forming the products of multiple Fourier series using tensor like operations is demonstrated. This symbolic multiplication can be performed for any arbitrary number of series, and the coefficients of a set of linear differential equations with periodic coefficients from a rotating coordinate system to a nonrotating system is also demonstrated. It is shown that using Fourier operations to perform this transformation make it easily understood, simple to apply, and generally applicable. S.L.

MEMORY-BASED FRAME SYNCHRONIZER Patent

Raymond J. Stattel and James K. Niswander, inventors (to NASA) Issued 3 Nov. 1981 11 p Filed 12 Mar. 1980 Supersedes N80-20453 (18 - 11, p 1405)
(NASA-Case-GSC-12430-1; US-Patent-4,298,987; US-Patent-Appl-SN-129779; US-Patent-CLass-375-106; US-Patent-Class-375-114; US-Patent-Class-375-116; US-Patent-Class-370-100) Avail: US Patent and Trademark Office CSCL 09B

A frame synchronizer for use in digital communications systems wherein data formats can be easily and dynamically changed is described. The use of memory array elements provide increased flexibility in format selection and sync word selection in addition to real time reconfiguration ability. The frame synchronizer comprises a serial-to-parallel converter which converts a serial input data stream to a constantly changing parallel data output. This parallel data output is supplied to programmable sync word recognizers each consisting of a multiplexer and a random access memory (RAM). The multiplexer is connected to both the parallel data output and an address bus which may be connected to a microprocessor or computer for purposes of programming the sync word recognizer. The RAM is used as an associative memory or decorder and is programmed to identify a specific sync word. Additional programmable RAMs are used as counter decoders to define word bit length, frame word length, and paragraph frame length. M.G.

TRANSIENT ERROR RELIABILITY MODELS BASED ON DATA ANALYSIS Interim Report
Stephen R. McConnel and Daniel P. Siewiorek Jun. 1981 66 p refs
(ONR Proj. 048-645)
(AD-A106554; CMU-CS-81-128) Avail: NTIS HC A04/MF A01 CSCL 09/2

Experimental data on transient errors from several digital computer systems is presented and analyzed. This is the first large scale public study on the statistical distribution of transient errors. The systems for which data has been collected are the DEC PDP-10 series computers, the CM (trademark) multiprocessor, and the C.vmp fault tolerant microprocessor. Statistical tests indicate that transient errors follow a decreasing hazard rate distribution. This is at variance with the standard assumption of constant hazard rates (exponential distribution) used in reliability modeling, and requires models of greater complexity for accurate results. Models of common fault tolerant redundant structures are developed using the Weibull distribution, which has a time-varying hazard rate. Both analytical and simulation models are used to analyze the differences between the reliabilities predicted by Weibull based transient error models and those predicted by exponential based models. The analysis indicates a significant difference between the models based on the exponential distribution and those based on the decreasing hazard rate Weibull distribution. Reliability differences ranging from -0.10 to +0.20 and factors greater than 2.0 in Mission Time Improvement for Weibull parameters equivalent to measured system behavior are seen in the model results. System designers should be aware of these differences. Author (GRA)

A HIGH LEVEL LANGUAGE FOR DATA ACQUISITION AND PROCESS CONTROL [LANAC - UMA LINGUAGEM DE ALTO NIVEL PARA AQUISICAO DE DADOS E CONTROLE DE PROCESSOS]
Francisco Edwardo deCarvalhoviola, Sergio Donizetti Fischer, and Celso deRennae Souza Jul. 1981 12 p refs In PORTUGUESE; ENGLISH summary Presented at the 1st Congr. da Soc. Brasileira de Computacao (VIII SEMISH) Florianopolis, Brazil, 27-31 Jul. 1981
(INPE-2173-RPE/389) Avail: NTIS HC A02/MF A01

An ALGOL like language, LANAC, with statements in Portuguese, without recursion, is described. It was developed at INPE/CNPq for minicomputers applied in real time systems; so it has available SEMAPORES for concurrent process synchronization. The LANAC compiler was written in B6800 EXTENDED ALGOL, producing assemly code, in its first version, for the Hewlett-Packard 2116B minicomputer. The usefulness of the LANAC language for real time systems programming was verified. Code generators for other minicomputers are implemented and more powerful data and control structures are introduced into the language. S.L.

ANAPHORA FOR LIMITED DOMAIN SYSTEMS
Philip J. Hayes 30 Jul. 1981 17 p refs Submitted for publication
(Contract F33615-78-C-1551; ARPA Order 3597)
(AD-A106559; CMU-CS-81-136) Avail: NTIS HC A02/MF A01 CSCL 05/8

This paper presents a simple mechanism for the resolution of anaphora in limited domain natural language systems. This mechanism provides functionality equivalent to the natural communication mechanism of anaphora as used and understood by people, but without the deep inferencing or cognitive modelling required for full simulation of human performance. The mechanism covers simple pronoun anaphora, and set selection anaphora (e.g., 'last one', 'one before', 'others'). It was developed to provide the most efficient and effective communication between system and user, even if this meant diverging significantly from human performance when this performance was impractical to reproduce. In cases of radical divergence, we were careful to make the behavior of the mechanism very simple and easy to predict. In this way, the user can either rely on his experience of human performance or his knowledge of the artificial, but simple, substitute to predict the behaviour of the system in response to his inputs, and thus construct his inputs to use the mechanism to best advantage. An algorithmic description of an implemented version of the mechanism is presented. A similar approach to other aspects of man-machine interfaces is recommended as a promising way to address the problem of habitability that still plagues all natural language computer interfaces. WRITING EFFICIENT CODE Interim Report
Jon Louis Bentley 27 Apr. 1981 72 p refs
(AD-A106553; CMU-CS-81-116) Copyright. Avail: Issuing Activity CSCL 09/2

The most important step in making a software system efficient is the proper selection of data structures and algorithms; many papers and textbooks have been devoted to these topics. Most discussions, however, neglect another important activity: that of writing machine-independent efficient code. This paper examines a set of techniqes for accomplishing that step. We examine those techniques both in an abstract setting and in their application of a real program, where they led to a speedup of a factor of over six. Because these techniques should be employed rarely, an important part of this paper is describing exactly when one should (and should not) use them. Author (GRA)

TOWARD A UNIFIED LOGICAL BASIS FOR PROGRAMMING LANGUAGES
Chih-sung Tang Jun. 1981 22 p refs
(Contract N00014-76-C-0687; Grant AF-AFOSR-0014-81)
(AD-A106772; SU-STAN-CS-81-865) Avail: NTIS HC A02/MF A01 CSCL 09/2

In recent years, more and more computer scientists have been paying attention to temporal logic, since there are many properties of programs that can be described only be bringing the time parameter into consideration. But existing temporal logic languages, such as Lucid, in spite of their mathematical elegance, are still far from practical. I believe that a practical temporal-logic language, once it came into being, would have a wide spectrum of applications. XYZ/E is a temporal-logic language. Like other logic languages, it is a logic system as well as a programming language. But unlike them, it can express all conventional data structures and control structures, nondeterminate or concurrent programs, even programs with branching-time order. We find that the difficulties met in other logic languages often stem from the fact that they try to deal with these structures in a higher level. XYZ/E adopts another approach. We divide the language into two forms: the internal form and the external form. The former is lower level, while the latter is higher. Just as any logic system contains rules of abbreviation, so also in XYZ/E there are rules of abbreviation to transform the internal form into the external form, and vice versa. These two forms can be considered to be different representations of the same thing. We find that this approach can ameliorate many problems of formalization. Not only does XYZ/E have various practical applications, it also has a theoretical impact. GRA

THREE-DIMENSIONAL DIGITAL LINE SEGMENTS

Chul E. Kim Aug. 1981 21 p refs

(Grant AF-AFOSR-3271-77; AF Proj. 2304)

(AD-A106813; TR-1087; AFOSR-81-0707TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Digital arcs in 3D digital pictures are defined. The digital image of an arc is also defined. A digital arc is defined to be a digital line segment if it is the digital image of a line segment. It is shown that a digital line segment may be characterized by the chord property holding for its projections onto the coordinate planes. It is also shown that a digital line segment may not be characterized by its own chord property. A linear time algorithm is presented that determines whether or not a digital arc is a digital line segment. Author (GRA)

QUSER USER'S GUIDE

Mark D. Buck Sep. 1981 77 p refs

(Contract DE-AC01-80EI-11975)

(DE81-030681; DOE/EIA-11975/T1) Avail: NTIS HC A05/MF A01

The QUSER program functions as the controlling routine of the Midterm Energy Market Model (MEMM). In MEMM, a linear program (LP) is solved iteratively until QUSER determines that all convergence criteria have been met. After each iteration, QUSER is called to calculate new input prices and demands for the next iteration of the LP. The LP solution is considered to be a converged solution when the prices and demands input to the last iteration and the prices and demands from the LP solution differ by less than two percent. QUSER's other main function is to model energy pricing regulations for natural gas and electricity. These policies are based on average prices while the LP solution gives marginal prices. The program uses FORTRAN language. DOE

THE HEURISTIC OF GEORGE POLYA AND ITS RELATION TO ARTIFICIAL INTELLIGENCE

Allen Newell Jul. 1981 56 p refs Presented at Intern. Symp. on the Methods of Heuristic, Bern, 15-18 Sep. 1980 Submitted for publication
(Contract F33615-78-C-1551; ARPA Order 3697)
(AD-A106557; CMU-CS-81-133) Avail: NTIS HC A04/MF A01 CSCL 09/2

Polya's fundamental work in heuristic is well known and well regarded in artificial intelligence. However, no one has built seriously on his work, e.g., by constructing programs that make use of his heuristic. This paper attempts to understand why this might be the case. First, an attempt is made to characterize the nature of Polya's heuristic. Then six theses are put forward that might account for the failure of his work to have a major impact. Three are easily discarded, but three are serious candidates: that the essential heuristic knowledge is not captured in Polya's work; that the emphasis on learning in Polya's heuristic is beyond the current art in artificial intelligence; and that the use of auxiliary problems is beyond the current art. This last thesis is explored in detail in the remainder of the paper. Some interesting concepts emerge, particularly the notion of object-centered problem space and the contrast between tame and wild subproblems. Author (GRA)

THE KNOWLEDGE LEVEL

Allen Newell Jul. 1981 51 p refs Presented at Am. Assoc. for Artificial Intelligence, Stanford, Calif. Submitted for publication
(Contract F33615-78-C-1551; ARPA Order 3597)
(AD-A106556; CMU-CS-81-131) Avail: NTIS HC A04/MF A01 CSCL 09/2

This paper focuses on a basic substantive problem: the nature of knowledge and representation. There are ample indications that artificial intelligence is in need of substantial work in this area. The paper proposes a theory of the nature of knowledge, namely, that there is another computer system level immediately above the symbol (or program) level. The nature of computer system levels is reviewed, the new level proposed, and its definition is treated in detail. Knowledge itself is the processing medium at this level and the principle of rationality plays a central role. Some consequences of the existence of the knowledge level and some relations to other fields are discussed. GRA

THE K-D-B-TREE: A SEARCH STRUCTURE FOR LARGE MULTIDIMENSIONAL DYNAMIC INDEXES Interim Report

John T. Robinson Feb. 1981 24 p refs
(Contract N00014-76-C-0370; Grant NSF MCS-78-23676)
(AD-A106550; CMU-CS-81-106) Avail: NTIS HC A02/MF A01 CSCL 12/1

The problem of retrieving multikey records via range queries from a large, dynamic index is considered. By 'large' it is meant that most of the index must be stored on secondary memory. By 'dynamic' it is meant that insertions and deletions are intermixed with queries, so that the index cannot be built beforehand. A new data structure, the K-D-B-tree, is presented as a solution to this problem. K-D-B-trees combine properties of K-D-trees and B-trees. It is expected that the multidimensional search efficiency of balanced K-D-trees and the I/O efficiency of B-trees should both be approximated in the K-D-B-tree. Preliminary experimental results that tend to support this are reported. Author (GRA)

NON-LINEAR REGRESSION MODELS: A STUDY OF THE PRINCIPAL ESTIMATION METHODS

Luiz Antonio Nogueira Lorena Jul. 1981 20 p refs In PORTUGUESE; ENGLISH summary Presented at the 13th Coloquio de Mat., Pocos de Caldas, 12-24 Jul. 1981
(INPE-2183-RPE/394) Avail: NTIS HC A02/MF A01

A study of the main methods used for parameter estimation in nonlinear regression models is studied. The classical methods of Gauss-Newton, gradient, and Marquardt are presented, with their power and limitations discussed, and suggestions for computer implementation are given. The approach that uses the solution of the normal equations, where the coefficient matrix appear in the 'correlation' matrix form, is presented, using the Cholesky decomposition. Modern implementations, using orthogonal decompositions, are referenced as alternative to the use of normal equations. Finally, alternative methods to the linearization are presented, as well as study of the conditioning problem for the normal equations. S.L.

The investigators associated with this contract produced 17 documents on the broad area of sparse matrices. They recorded research on algorithmic and software development of direct sparse linear equation solvers. Also, the examination of problems involving sparse matrices that arise in the numerical solution of partial differential equations is included. The development of the Yale Sparse Matrix Package, a computer software package to efficiently solve directly large sparse systems, is indeed one of the highlights of this research. It has been independently tested and found exceptional in solving symmetric problems. Author (GRA)

NONPOLYNOMIAL AND INVERSE INTERPOLATION FOR LINE SEARCH: SYNTHESIS AND CONVERGENCE RATES

J. Barzilai and A. Ben-Tal (Technion - Israel Inst. of Technology) Jul. 1981 37 p refs
(Contracts N00014-75-C-0569; N00014-80-C-0242)
(AD-A106680; CCS-RR-409) Avail: NTIS HC A03/MF A01 CSCL 12/1

The rate of convergence of line search algorithms based on general interpolating functions is derived, and is shown to be independent of the particular interpolating function used. This result holds for the root finding problem $f(x) = 0$ as well. We show how inverse interpolation can be used in conjunction with the line search problem, and derive its rate of convergence. Our analysis suggests that one-point line search algorithms (in particular Newton's method) are inefficient in a sense. Two-point algorithms using rational interpolating functions are recommended. THE H-FUNCTION AND PROBABILITY DENSITY FUNCTIONS OF CERTAIN ALGEBRAIC COMBINATIONS OF INDEPENDENT RANDOM VARIABLES WITH H-FUNCTION PROBABILITY DISTRIBUTION Ph.D. Thesis

Ivy Dewey Cook, Jr. May 1981 243 p refs
(AD-A106768; AFIT-CI-81-47D) Avail: NTIS HC A11/MF A01 CSCL 12/1

A practical technique is presented for determining the exact probability density function and cumulative distribution function of a sum of any number of terms involving any combination of products, quotients, and powers of independent random variables with H-function distributions. The H-function is the most general named function, encompassing as special cases most of the other special functions of mathematics and many of the classical statistical distributions. Its unique properties make it a powerful tool for statistical analysis. In particular, the product, quotient, and powers of independent H-function variates are also H-function variates, and the Laplace and Fourier transforms and the derivatives of an H-function are readily-determined H-functions. This dissertation provides background material, including history on H-functions and the algebra of random variables and definition, properties and special cases of the H-function. For determining whether convergence of a general Mellin-Barnes integral or an H-function occurs with left-half-plane versus right-half-plane summation of residues, evaluation guidelines are formally established and applied to the known special cases, the Laplace transform, and the derivatives of the H-function. Then, a new, improved formulation for evaluation of an H-function by summing residues is derived. GRA

DOMINATION PROBLEM FOR VECTOR MEASURES AND APPLICATIONS TO NONSTATIONARY PROCESSES

M. M. Rao 23 Sep. 1981 22 p refs
(Contract N00014-79-C-0754)
(AD-A106375; TR-4) Avail: NTIS HC A02/MF A01 CSCL 12/1

In this paper the question of finite p-variation and its representation (via the Radon-Nikodym theory) will not be considered beyond its comparison, even though it is useful in the integral representation of certain linear operations. On the other hand, the problem of finite p-semi-variation has immediate interest for certain stochastic process representations, and that will be treated in a reasonably detailed fashion for a class of vector measures. DENSITY ESTIMATION AND PROJECTION PURSUIT METHODS

Peter J. Huber Sep. 1981 16 p refs
(Contract N00014-79-C-0512; Grant NSF MCS-79-08685)
(AD-A107816; PJH-7) Avail: NTIS HC A02/MF A01 CSCL 12/1

Recently, it has been proposed to use projection pursuit methods for multidimensional density estimation. This report discusses conceptual and technical issues in density estimation and describes several variant approaches to projection pursuit density approximation and estimation. A new measure of fit between multivariate densities is introduced (maximum marginal relative entropy), and some of its properties are derived; it seems to be particularly well adapted to projection pursuit density approximation. LIE GROUPS AND LIE ALGEBRAS IN VIDEO TRACKING Final Report, 1 Mar. 1980 - 28 Feb. 1981

Thomas G. Newman 26 Oct. 1981 58 p refs
(Contract DAAG29-80-C-0087)
(AD-A107858; ARO-17219.1-R-EL) Avail: NTIS HC A04/MF A01 CSCL 12/1

When a three-dimensional dynamic scene is projected to a two-dimensional image plane, a complex class of motions are observed, which may be approximated by translation and linear transformation. In this report, we show how such motion may be resolved into principal components and measured from 2 dimensional data. Lie theoretic techniques are used to obtain a motion model, and to incorporate generalized velocity measurements in a closed loop feedback tracker. Stability of numerical calculations is enhanced by a method based on an application of Stoke's Theorem to certain differential 2-forms. Author (GRA)

TESTING FOR GAUSSIANITY AND LINEARITY OF STATIONARY TIME SERIES

Melvin J. Hinich Oct. 1981 12 p refs
(Contract N00014-75-C-9494)
(AD-A017548; TR-23) Avail: NTIS HC A02/MF A01 CSCL 12/1

Stable autoregressive (AR) and autoregressive moving average (ARMA) processes belong to the class of stationary linear time series. A linear time series is Gaussian if the distribution of the independent innovations (sigma (t)) is normal. Assuming that E sigma (t) = 0, some of the third order cumulants sub C XXX (m,n) = Ex(t)X(t+n) will be non-zero if the sigma (t) are not normal and E sigma cube(t)=0. If the relationship between X(t) and sigma (t) is non-linear, then (X(t)) is non-Gaussian even if the sigma (t) are normal. This paper presents a simple estimator of the bispectrum, the Fourier transform of of (sub C XXX (m,n)). This sample bispectrum is used to construct a statistic to test whether the bispectrum of (x(t)) is non-zero. A rejection of the null hypothesis implies a rejection of the hypothesis that (x(t)) is Gaussian. A related test statistic is then presented for testing the hypothesis that (x(t)) is linear. The asymptotic proprties of the sample bispectrum are incoroprated in these test statistics. The tests are consistent as the sample size (N approaches infinity). GRA

APPLICATIONS OF RANDOM DIFFERENTIAL EQUATIONS TO ENGINEERING SCIENCE. WAVE PROPAGATION IN TURBULENT MEDIA AND RANDOM LINEAR HYPERBOLIC SYSTEMS Final Report, 1 Mar. 1975 - 31 Aug. 1981

Pao-Liu Chow 10 Nov. 1981 7 p refs
(Grants DAHC04-75-G-0091; DAAG29-76-G-0141; DAAG29-78-G-0042)
(AD-A108020; ARO-12360.11-M; ARO-15452.8-M) Avail: NTIS HC A02/MF A01 CSCL 12/1

Research has been conducted in two major problem areas: Applications of Random Differential Equations to Engineering Science. Wave Propagation in Turbulent Media and Random Linear Hyperbolic Systems. These two area are not disjoint. In fact the second problem area is a follow-up study on problems in the first one with emphasis on wave propagation in turbulent media. We have investigated several turbulence-related problems arising from engineering science. They include problems in wave propagation through turbulent media, turbulent transport theory, the surface roughness effect on hydrodynamic lubrication and wave scattering, and stability of elastic structures under random loading or with imperfections. In the theoretical aspect, the research is mainly concerned with the development of new methodology in solving differential equations with random coefficients, examination of the existing closure approximations with regards to their validity and possible improvements. Certain related mathematical questions are also studied. GRA

TRIDIF is a time dependent diffusion version of the well known PANDIRA-POISSON-TRIM triangular mesh magnet code. Modifications which allow TRIDIF to treat field diffusion in materials with time varying permeabilities are described. A heuristic dipole alignment model which describes major and minor hysteresis loops and frequency dependence was included to provide the requisite permeabilities. Good agreement between the measured and computed magnetic fields was found for a simple test experiment. DOE

Median smoothing, a filtering technique with wide application in digital signal and image processing, involves replacing each sample in a grid with the median of the samples within some local neighborhood. As implemented on conventional computers, this operation is extremely expensive in both computation and communication resources. This paper defines the running order statistics (ROS) problem, a generalization of median smoothing. It then summarizes some of the issues involved in the design of special purpose devices implemented with very large scale integration (VLSI) technology. Finally, it presents algorithms designed for VLSI implementation which solve the ROS problem and are efficient with respect to hardware resources, computation time, and communication bandwidth. ARMA SPECTRAL ESTIMATION: AN EFFICIENT CLOSED FORM PROCEDURE Final Report
James A. Cadzow Aug. 1981 13 p refs
(Grant AF-AFOSR-0069-80; AF Proj. 2305)
(AD-A106753; AFOSR-81-0727TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

In this report, an effective procedure for effecting on ARMA spectral model of a time series is described. This procedure is predicated on minimizing as set of 'basic error' terms as generated from an ARMA model that is hypothesized as characterizing the time series under analysis. The spectral estimation performance achieved in using this approach has been empirically found to be generally superior to that obtained using such contemporary methods as maximum entropy and the periodogram. QUANTILE ESTIMATION IN DEPENDENT SEQUENCES
P. Heidelberger (IBM Research Center, Yorktown Heights, N.Y.) and P. A. W. Lewis Sep. 1981 57 p refs
(RR140501)
(AD-A106132; NPS55-81-015) Avail: NTIS HC A04 A01 CSCL 12/1

Standard nonparametric estimators of quantiles based on order statistics can be used not only when the data are i.i.d., but also when the data are from a stationary, phi-mixing process of continuous random variables. However, when the random variables are highly positively correlated, sample sizes needed for acceptable precision in estimates of extreme quantiles are computationally unmanageable. A practical scheme is given, based on a maximum transformation in a two-way layout of the data, which reduces the sample size sufficiently to allow an experimenter to obtain a point estimate of an extreme quantile. Three schemes are then given which lead to confidence interval estimates for the quantile. One uses a spectral analysis of the reduced sample. The other two, averaged group quantiles and nested group quantiles, are extensions of the method of batched means to quantile estimation. None of the schemes requires that the process being simulated is regenerative. Author (GRA)

THE DESIGN OF MULTIACTIVITY MULTIFACILITY SYSTEMS
Richard M. Soland 15 Jun. 1981 32 p refs
(Contract N00014-75-C-0729; Grant NSF ECS-79-11909; NR Proj. 347-020)
(AD-A107670; SERIAL-T-444) Avail: NTIS HC A03/MF A01 CSCL 12/1

We consider a service/distribution system in which each of N activities is to be carried out at one or several facility locations according to one of a specified set of configurations; each configuration is a specific subset of the set of L facilities being considered, along with a specific strategy for their use. We call such a system a multiactivity multifacility system and present a mathematical formulation for its optimal design that includes capacity restrictions at the facilities and the treatment of multiple criteria. The design problem is simply to choose an appropriate configuration for each of the N activities. We discuss various criteria and we show that the multiactivity multifacility design problem includes many familiar discrete location problems as special cases. We introduce a 0-1 linear optimization model called the team generalized assignment problem (T-GAP) and show that parametric solution of a T-GAP will yield all efficient solutions of the multiactivity multifacility design problem with multiple criteria. Rather than attempting to find all efficient solutions, however, we advocate an interactive approach and describe an interactive branch-and-bound algorithm that solves the design problem as a finite sequence of T-GAPs. We also discuss efficient ways to solve T-GAPs. Author (GRA)

REGIONAL MONTE CARLO SOLUTION OF ELLIPTIC PARTIAL DIFFERENTIAL EQUATIONS
Thomas E. Booth 1981 8 p refs Presented at the ANS Winter Meeting, San Francisco, 29 Nov. 1981
(Contract W-7405-eng-36)
(DE81-028772; LA-UR-81-2138; CONF-811103-19) Avail: NTIS HC A02/MF A01

A continuous random walk procedure for solving some elliptic partial differential equations at a single point is generalized to estimate the solution everywhere. The Monte Carlo method described is exact (except at the boundary) in the sense that the only error is the statistical sampling error that tends to zero as the sample size increases. A method to estimate the error introduced at the boundary is provided so that the boundary error can always be made less than the statistical error. DOE

CONFLICT AMONG TESTING PROCEDURES IN A LINEAR REGRESSION MODEL
Daniel F. Kohler Oct. 1981 16 p refs
(RAND/P-6691) Avail: NTIS HC A02/MF A01

It is shown that for finite but large samples an inequality relation exists between the powers of the likelihood ratio test statistic, the Wald test statistic, and the Lagrange multiplier test statistic. The Wald test is uniformly more powerful than either of the other two tests, and the likelihood ratio test is more powerful than the Lagrange multiplier test for very large samples and for moderate to large differences between the null hypothesis and the true value of the tested parameters. The assumption of a scalar covariance matrix is made to simplify the exposition. The results can probably be generalized to hold for any disturbance vector which allow maximum likelihood estimation. [OPTICALLY PUMPED POLARIZED ION SOURCES] Technical Progress Report, 1 Feb. - 30 May 1981
Jul. 1981 27 p refs
(Contract DE-AC02-81ER-40001)
(DE81-026306; DOE/ER-40001/1) Avail: NTIS HC A03/MF A01

Progress on the development of optically pumped polarized ion sources is reported. The production of polarized Li(+) or Na(+) ions is based on the production of Li or Na atoms by an atomic oven, polarization of the Li or Na atoms by optical pumping, ionization on a heated oxidized tungsten surface to form Li(+) or Na(+) ions, and converted to polarized Li(-) or Na(-) ions in a potassium or cesium vapor cell. The conversion of (3)He(+) ions into polarized (3)He(-) ions will be accomplished by the pickup in a low magnetic field of two electrons in two separate collisions in an optically pumped electron spin polarized Na vapor target. Polarized H(-) ions are produced by using an optically pumped electron spin polarized Na vapor target in a large magnetic field to partially convert H(+) ions into electron spin polarized HO atoms. The electron spin polarization is transferred to the proton by a Sona diabatic transition. The fast nuclear polarized HO atoms are then partially converted to polarized H(-) ions in a second unpolarized alkali vapor target. DOE

HIGH FREQUENCY SCATTERING BY A SPHERE WITH COMPLEX SURFACE IMPEDANCE Ph.D. Thesis
Paul David Jackins 1981 184 p
Avail: Univ. Microfilms Order No. 8123263

The scattering of a plane scalar wave by an impedance sphere at high frequencies is treated by a modified Watson transformation. The location of the poles in the complex order plane is determined for spheres whose surface impedence is either large or small. The interpretation of the angular momentum poles in terms of surface waves is demonstrated and shown to be in agreement with Keller's geometrical theory of diffraction. The amplitude and phase velocities of these surface or creeping waves are shown to depend in part upon the surface impedance. Representations are obtained for the primary waves in the nearby lit region and backward half space of the near field. The diffraction effects in the neighborhood of the shadow boundary are investigated and compared with classical diffraction theory. Near field solutions are extended to the far field by using the large argument asymptotic expressions for the Hankel functions.

MULTIPLE PURE TONE ELIMINATION STRUT ASSEMBLY Patent
Frank W. Burcham, inventor (to NASA) Issued 17 Nov. 1981 4 p Filed 11 Sep. 1980 Supersedes N80-32393 (18 - 23, p 3094)
(NASA-Case-FRC-11062-1; US-Patent-4,300,656;
US-Patent-Appl-SN-185869; US-Patent-Class-181-214) Avail: US Patent and Trademark Office CSCL 20A

An acoustic noise elimination assembly is disclosed which has a capability for disrupting the continuity of fields of sound pressures forwardly projected from fans or rotors of a type commonly found in the fan or compressor first stage for air-breathing engines, when operating at tip speeds in the supersonic range. The assembly includes a tubular cowl defining a duct for delivering an air stream axially into the intake for a jet engine. A sound barrier, defined by a number of intersecting flat plates or struts has a line of intersection coincident with a longitudinal axis of the tubular cowl, which serves to disrupt the continuity of rotating fields of multiple pure tonal components of noise.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Annual Progress Report
Carl H. Gerhold Jan. 1982 39 p refs
(Grant NAG1-11)
(NASA-CR-165102; APR-2) Avail: NTIS HC A03/MF A01 CSCL 20A

Progress in the refinement and evaluation of an analytical jet shielding model are summarized. The model consists of a point noise source impinging on a cylinder of heated flow in which the temperature and velocity are uniform across the cross section of the jet. The shielding jet is infinite in extent along the jet axis and the radius of the jet is constant. The analytical model was compared to experimental data for a point noise source impinging on an ambient temperature, subsonic jet and on a subsonic simulated hot jet using helium as the flow medium. Results of these comparisons are discussed. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Semiannual Progress Report
Carl H. Gerhold 30 Jun. 1981 26 p refs
(Grant NAG1-11)
(NASA-CR-165103) Avail: NTIS HC A03/MF A01 CSCL 20A

Development of jet noise source model, and comparison to experiments with a point noise source are summarized. The refinement of the noise source is expected to resolve discrepancies noted between previous analytical results with a point noise source model and experimental results for twin-jet shielding. Comparison of the analytical model with experimental program which include shielding of a point noise source by a jet and twin jet shielding are also made. The comparisons should serve to define more completely the mechanisms of shielding M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Annual Progress Report
Carl H. Gerhold 31 Dec. 1980 38 p refs
(Grant NAG1-11)
(NASA-CR-165104) Avail: NTIS HC A03/MF A01 CSCL 20A

An analytical model a three-dimensional model, of twin-jet shielding, consisting of a point noise source impinging on a cylinder of heated flow in which the temperature and flow velocity are uniform across the cross-section is discussed. Wave equations are given for the regions outside the flow and within the flow cylinder and solutions are matched at the jet boundary under the conditions of continuity of pressure and continuity of the vortex sheet The model was analyzed to identify mechanisms of transmission and diffraction which control sheilding in the shadow of the shielding jet. It was found that in the zone of the shadow region dominates, shielding is relatively insensitive to variations of such parameters as Mach Number and spacing ratio, but in the zone in which diffraction dominates: shielding is more sensitive to variations in Mach Number, jet temperature and spacing ratio. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Semiannual Progress Report
Carl H. Gerhold 6 Jun. 1980 18 p refs
(Grant NAG1-11)
(NASA-CR-165105) Avail: NTIS HC A02/MF A01 CSCL 20A

The development of an analytical model, an aircraft noise prediction computer program, to estimate the shielding of one jet by an adjacent jet in a twin jet configuration, is discussed. Noise estimations included consideration not only of noise sources on the aircraft, but also of the propagation path between source and receiver. A three-dimensional case is considered in which noise source is a discrete frequency point source at rest with respect to the jet axis. The shielding jet is assumed to be a cylinder of heated flow in which the temperature and flow velocity profiles are constant across the jet. The effect on shielding of the orientation of the emitting jet with respect to the shielding jet was investigated. Forward and backward scattering phenomena as well as the influence of jet flow speed were also investigated. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING DEVELOPMENT OF A 3-DIMENSIONAL MODEL Progress Report
Carl H. Gerhold 4 Nov. 1980 24 p refs Sponsored by NASA
(NASA-CR-165106) Avail: NTIS HC A02/MF A01 CSCL 20A

The solution for a point source impinging on a cylinder of heated flow is presented. The indefinite integral is solved approximately using a saddle of point method. Comparison of the three-dimensional model to a previously obtained two-dimensional model of twin jet noise indicate the the approximate solution of the integral is valid. The model was analyzed to differentiate among the mechanims of shielding. Zone in which diffraction and transmission dominate are identified. The model was found to compare to experimental shielding results. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING TWO-DIMENSIONAL MODEL

Carl H. Gerhold 15 Aug. 1980 17 p refs
(Grant NAG1-11)
(NASA-CR-165107) Avail: NTIS HC A02/MF A01 CSCL 20A

The development of an analytical model to estimate the shielding of one jet by an adjacent jet in a twin jet configuration is discussed in relation to aircraft generated noise. The azimuthal redistribution of sound defining the shadow zone is investigated. Wave equations were solved in the plane normal to the jet axis to estimate the diffraction and reflection of sound by a heated, cylindrical jet. Thus, the noise source considered is essentially a line source assumed to emit at discrete frequency and at rest with respect to the shielding jet which is assumed to be a cylinder of heated flow in which the temperature is constant across the jet. Results show that the sound pressure decreases rapidly with frequency beyond the onset of the shielding to a minimum value. Results also show that increasing the spacing between the source and the jet shifts the curves toward higher frequencies. M.D.K.

COMMUNITY SENSITIVITY TO CHANGES IN AIRCRAFT NOISE EXPOSURE Final Report

S. Fidell, R. Horonjeff, S. Teffeteller, and K. Pearsons NASA Dec. 1981 122 p refs
(Contract NAS1-14611)
(NASA-CR-3490; BBN-4212) Avail: NTIS HC A06/MF A01 CSCL 20A

Interviews were conducted in the vicinity of Burbank Airport during a four month period during which a counterbalanced series of changes in aircraft noise exposure occurred due to runway repairs. Another interview was undertaken approximately one year after completion of the initial runway repairs. Noise measurements were made in conjunction with administration of a brief questionnaire to a near exhaustive sample of residents in four airport neighborhoods. The magnitude and direction of change of annoyance with aircraft noise exposure corresponded closely to the actual changes in physical exposure. Estimates were made of time constants for the rate of change of attitudes toward aircraft noise. S.L.

NOISE OF THE SR-3 PROPELLER MODEL AT 2 DEG AND 4 DEG ANGLE OF ATTACK

James H. Dittmar and Robert J. Jeracki Dec. 1981 30 p refs
(NASA-TM-82738; E-1051) Avail: NTIS HC A03/MF A01 CSCL 20A

The noise effect of operating supersonic tip speed propellers at angle of attack with respect to the incoming flow was determined. Increases in the maximum blade passage noise were observed for the propeller operating at angle of attack. The noise increase was not symmetrical with one wall of the wind tunnel having significantly more noise increase than the other wall. This was apparently the result of the rotational direction of the propeller. The lack of symmetry of the noise at angle of attack to the use of oppositely rotating propellers on opposite sides of an airplane fuselage as a way of minimizing the noise due to operation at angle of attack. J.D.H.

A SHOCK WAVE APPROACH TO THE NOISE OF SUPERSONIC PROPELLERS

James H. Dittmar and Edward J. Rice Dec. 1981 19 p refs
(NASA-TM-82752; E-1068) Avail: NTIS HC A02/MF A01 CSCL 20A

To model propeller noise expected for a turboprop aircraft, the pressure ratio across the shock at the propeller tip was calculated and compared with noise data from three propellers. At helical tip Mach numbers over 1.0, using only the tip shock wave, the model gave a fairly good prediction of the noise for a bladed propeller and for a propeller swept for aerodynamic purposes. However for another propeller, which was highly swept and designed to have noise cancellations from the inboard propeller sections, the shock strength from the tip over predicted the noise. In general the good agreement indicates that shock theory is a viable method for predicting the noise from these supersonic propellers but that the shock strengths from all of the blade sections need to be properly included. PREDICTION OF SOUND RADIATION FROM DIFFERENT PRACTICAL JET ENGINE INLETS Semiannual Status Report, 1 Jun. 1981 - 1 Dec. 1981

Ben T. Zinn and William L. Meyer 1982 127 p refs
(Grant NAG3-67)
(NASA-CR-165120) Avail: NTIS HC A07/MF A01 CSCL 20A

The computer codes necessary for this study were developed and checked against exact solutions generated by the point source method using the NASA Lewis QCSEE inlet geometry. These computer codes were used to predict the acoustic properties of the following five inlet configurations: the NASA Langley Bellmouth, the NASA Lewis JT15D-1 Ground Test Nacelle, and three finite hyperbolic inlets of 50, 70 and 90 degrees. Thirty-five computer runs were done for the NASA Langley Bellmouth. For each of these computer runs, the reflection coefficient at the duct exit plane was calculated as was the far field radiation pattern. These results are presented in both graphical and tabular form with many of the results cross plotted so that trends in the results verses cut-off ratio (wave number) and tangential mode number may be easily identified. NOISE GENERATION BY GAS JETS IN A TURBULENT WAKE Ph.D. Thesis

John J. Gavigan 9 Apr. 1981 124 p refs
(Contract N00024-79-C-6043)
(AD-A106223; ARL/PSU-TM-81-99) Avail: NTIS HC A06/MF A01 CSCL 20/1

Radiation noise is generated by the interaction of gas jets with turbulent liquid. Although this phenomenon has long been known, the mechanism of noise generation and its functional relationship to important parameters are not well understood. No experimental studies of gas jet-turbulence interaction noise under controlled conditions can be found in the literature. To remedy this paucity of experimental data, measurements of this phenomenon were made in the 1.22 m diameter test section of the Garfield Thomas Water Tunnel. Gas was exhausted from the aft end of the strut-mounted test body into the turbulent wake. A directional hydrophone mounted outside the flow in a water-filled tank on one side of the test section was used to make one-third-octave-band acoustic measurements in the frequency range 5 - 50 kHz. By varying the gas exhaust orifice diameters, gas flow rates, and water speeds, the interdependence of the important parameters to radiated noise was determined. For the range of variables used in these experiments, the radiated noise is primarily a function of the ratio of orifice diameter to turbulence length scale, and only secondarily, a function of gas flow rates. Analysis of the results indicate that noise generated by the formation, division, coalescence, and collapse of bubbles can be related to the critical Weber number of the flow. Author (GRA)

APPROXIMATE FLUID-STRUCTURE INTERACTION THEORIES FOR ACOUSTIC ECHO SIGNAL PREDICTIONS Final Report

H. Huang Oct. 1981 17 p refs
(RR0230301)
(AD-A106349; NRL-MR-4661) Avail: NTIS HC A02/MF A01 CSCL 17/1

An approximation scheme for predicting the acoustical echo signals from submerged elastic structures irradiated by incident pulses is proposed and investigated for its effectiveness. This scheme utilizes various approximate fluid-structure interaction theories to first determine the resultant pressure and normal acceleration on the fluid-structure interface and thereform calculates the far field echo signals by integrating the Helmholtz integral exactly. It is found that a theory termed the second order doubly asymptotic approximation is promising for this scheme. An optimum computation scheme could be a combination of the exact and various approximate theories depending on the wavelength of the incident pulse and the geometry and the dynamic characteristics of the structure. MEASUREMENTS AND ANALYSIS OF ACOUSTIC BOTTOM INTERACTION IN THE NORTHWESTERN MEXICAN BASIN

Michael W. Hooper, Gregory D. Ingram, and Stephen K. Mitchell 5 Oct. 1981 54 p refs
(Contract N00014-78-C-0329)
(AD-A107551; ARL-TR-81-37) Avail: NTIS HC A04/MF A01 CSCL 08/10

An engineering test of the Acoustic Data Capsule (ACODAC) was conducted in the Western Gulf of Mexico on 27 April 1979. In addition, bottom loss data were collected. These data were reduced using ARL:UT's multipath processing system. Calculated bottom loss increased with frequency and bottom grazing angle, ranging from approximately 1 dB to 6 dB. Using available geoacoustic data and a bottom loss model, theoretical bottom losses were generated. A good match between actual and theoretical values was obtained. Thus, a relatively accurate geoacoustic model of the Western Gulf of Mexico was derived. Author (GRA)

ION-BEAM-ENHANCED ADHESION IN THE ELECTRONIC STOPPING REGION

J. E. Griffith (Bell Telephone Lab., Murray Hill, N.J.), Yuanxun Qiu (Lanzhou Univ., China), and T. A. Tombrello Dec. 1981 12 p refs Submitted for publication
(Grants NGR-05-002-333; NSF PHY-79-23638; Contract NGW-148)
(NASA-CR-163467; BAP-25) Avail: NTIS HC A02/MF A01 CSCL 20H

The use of ion beams in the electronic stopping region to improve the adhesion of insulators to other materials is described. In particular, the bonding of Au films to Teflon, ferrite, and SiO2 was improved by bombarding them with He and Cl, respectively. Improvements in bonding were also observed for Au on glass, Au and Cu on sapphire, and Si3N4 on Si. The mechanism is apparently associated with sputtering and track forming processes occurring in the electronic stopping region. Some applications are discussed. M.G.

THE TWO-PHOTON ABSORPTIVITY OF ROTATIONAL TRANSITIONS IN THE A2 SIGMA HYPERON + (V PRIME = O) - X-2 PION (V PRIME PRIME = O) GAMMA BAND OF NITRIC OXIDE

K. P. Gross (Stanford Univ., Calif.) and R. L. McKenzie Jan. 1982 28 p refs
(NASA-TM-81335; A-8758) Avail: NTIS HC A03/MF A01 CSCL 20H

A predominantly single-mode pulsed dye laser system giving a well characterized spatial and temporal output suitable for absolute two-photon absorptivity measurements was used to study the NO gamma(0,0) S11 + R21 (J double prime = 7-1/2) transition. Using a calibrated induced-fluorescence technique, an absorptivity parameter of 2.8 + or - 1.4 x 10 to the minus 51st power cm to the 6th power was obtained. Relative strengths of other rotational transitions in the gamma(0,0) band were also measured and shown to compare well with predicted values in all cases except the O12 (J double prime = 10-1/2) transition. INVESTIGATIONS OF NONREACTIVE VIBRATIONAL AND ROTATIONAL EXCITATION IN SMALL, POTENTIALLY REACTIVE ION MOLECULE SYSTEMS AT ENERGIES BELOW 6eV Ph.D. Thesis - Georg-August Univ. [UNTERSUCHUNGEN ZUR NICHTREAKTIVEN VIBRATIONS- UND ROTATIONSANREGUNG IN KLEINEN, POTENTIELL REAKTIVEN ION-MOLEKUELSYSTEMEN BEI ENERGIEN UNTERHALB VON 6eV]

Wolfgang Tepperwien Apr. 1981 93 p refs In GERMAN
(MPIS-4/1981; ISSN-0436-1199) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 16,50

The excitation of vibrational and rotational degree of freedom of molecules during ionic collision, a chemical elementary process related to chemical kinetics, is discussed. Molecular radiation experiments with single collisions were performed. Nonreactive vibrational and rotational excitation with small potential reactive ion molecule systems were investigated. Mostly higher vibrational changes take place. It is found that the hydrogen molecules are vibrationally excited by the collision, while the rotational degree of freedom remains relaxed. PHYSICS OF ELECTROSTATIC LENS Final Report

Sep. 1981 3 p
(Contract N00014-79-C-0749)
(AD-A105262) Avail: NTIS HC A02/MF A01 CSCL 20/7

The purpose of this program was to study the physics of the ion-energy boosting electrostatic lens for collective ion acceleration in the Luce diode. Extensive work was done in preparation for experiments on the PI Pulserad 1150. Analytic work was done on the orbit of protons in a mass spectrometer and a copper stack for nuclear activation analysis of proton energy spectrum has been designed. Unfortunately, a parallel program which would provide the Luce diode for the collective ion acceleration experiment never materialized. As a result no experiments were actually performed on the Pulserad 1150. GRA

COMPUTATIONAL STUDY OF MAGNETIC DAM EFFECTS IN A HIGH IMPEDANCE DIODE

R. J. Barker, Shyke A. Goldstein, and A. T. Drobot (Science Applications, Inc., McLean, Va.) Washington NRL 14 Oct. 1981 41 p refs Sponsored by Navy
(AD-A106154; NRL-MR-4642) Avail: NTIS HC A03/MF A01 CSCL 02/7

Computer simulations have been conducted to test the 'magnetic dam' concept as a means for boosting the overall ion efficiency of high impedance diodes. The 'dam' consists of a cell located immediately behind the anode foil containing a wire along its central axis which carries a current flowing in a direction opposite to that in the diode gap. The azimuthal magnetic field generated by the wire current, I sub w, reflects the electrons crossing the foil back into the A-K gap at higher radii where their space charge can enhance ion emission over relatively large areas. Significant increases in the ion current were observed for several values of I sub w but a simultaneous increase in electron current prevented gains in overall ion efficiency. Instead, only decreased impedances were observed. The cause of this phenomenon is explained and indicates solutions which could benefit a wide range of future diode designs. Author (GRA)

(Contract N00014-75-C-0498)
(AD-A107991) Avail: NTIS HC A02/MF A01 CSCL 12/1

This research program has had two principal streams of activity. The first, and the major consumer of effort, has been the computation of cross-sections and rate coefficients for significant collision processes between light atoms and ions. The other stream of activity has been development of computational methods in collision mechanics. The cross-section computations have on several occasions predicted experiments and/or corrected experimental errors. The prediction of the efficiency of the reaction Cs + H yields Cs(+) + H(-) was listed by the American Physical Society as a significant result for plasma physics in 1976. The first prediction of a process which could lead to a soft X-ray laser (Li + He(++) yields Li(+) + He(+*) yields Li(+) + He(+) + h(nu)) was made in 1978. The population inversion predicted has since been experimentally validated. Author (GRA)

MOLECULAR DYNAMICS CALCULATIONS FOR SODIUM USING PSEUDOPOTENTIAL THEORY Ph.D. Thesis - New Mexico Univ.

Richard E. Swanson Apr. 1981 193 p refs
(AD-A108014; AFIT-CI-81-11D) Avail: NTIS HC A09/MF A01 CSCL 20/8

We study the equation of state of sodium using the molecular dynamics technique whereby the classical motion of a system of ions is solved with the aid of computers. The interaction potential between pairs of sodium ions consists of Coulomb and Born-Mayer repulsion terms and an effective ion-ion interaction derived from pseudopotential theory. This theory includes the effects of electron gas screening, exchange, and correlation. We use a model pseudopotential with parameters fit to experimental low-temperature data. By using this technique, we are able to begin with an atomic description of a simple metal and proceed to calculate its macroscopic thermodynamic properties. We calculate equation-of-state points consisting of the total internal energy in volume and temperature space. We illustrate the unique capabilities of the molecular dynamics technique by inducing a dynamic bcc-to-hcp martensitic phase change. The results of this study demonstrate that the molecular dynamics technique, coupled with an interaction potential that adequately describes the ion-ion interaction in a simple metal, can be used to calculate the macroscopic properties of such systems. COLLISIONS OF FAST MULTICHARGED IONS IN GAS TARGETS: CHARGE TRANSFER AND IONIZATION

A. S. Schlachter May 1981 18 p refs Presented at the 2nd Workshop on EBIS and Related Topics, Paris, 11-15 May 1981
(Contract W-7405-eng-48)
(DE81-030541; LBL-13156; CONF-8105113-1) Avail: NTIS HC A02/MF A01

Measurements of cross sections for charge transfer and ionization of H2 and rare-gas targets were made with fast, highly stripped projectiles in charge states as high as 59+. An empirical scaling rule for electron-capture cross section in H2 valid at energies above 275 keV/amu was found. Similar scaling might exist for other target gases. Cross sections are generally in good agreement with theory. A scaling rule was found for electron loss from H in collisions with a fast highly stripped projectile, based on Olson's classical-trajectory Monte-Carlo calculations, and confirmed by measurements in an H2 target. A similar scaling rule was for net ionization of rare-gas targets, based on Olson's CTMC calculations and the independent-electron model. Measurements are essentially consistent with the scaled cross sections. Calculations and measurements of recoil-ion charge-state spectra show large cross sections for the production of highly charged slow recoil ions. DOE

CALCULATED NEUTRON AND GAMMA-RAY ENERGY SPECTRA FROM 14-MeV NEUTRONS STREAMING THROUGH AN IRON DUCT: COMPARISON WITH EXPERIMENT

R. T. Santoro, R. G. Alsmiller, Jr., J. M. Barnes, G. T. Chapman, and J. S. Tang Sep. 1981 64 p refs Submitted for publication
(Contract W-7405-eng-26)
(DE81-030626; ORNL/TM-7878) Avail: NTIS HC A04/MF A01

Integral experiments that measure the streaming of approximately 14 MeV neutrons through a 0.30 m diameter iron duct (L/D approximately 3) imbedded in a concrete shield were carried out. Calculated and measured neutron and gamma ray energy spectra are compared at sixteen detector locations on and off the cylindrical axis of the duct. The measured spectra were obtained using an NE-213 liquid scintillator detector with pulse shape discrimination to simultaneously resolve neutron and gamma ray events. The calculated spectra were obtained using a computer code network that incorporates discrete ordinates and Monte Carlo. These two radiation transport methodologies are required to properly account for neutrons that single scatter from the duct to the detector. The calculated and measured outgoing neutron energy spectra above 850 keV agree within 5 to 50% depending on detector location and neutron energy. The calculated and measured gamma ray spectra above 750 keV are also in favorable agreement, approximately 5 to 50%, depending on detector location and gamma ray energy. DOE

LOW-TEMPERATURE ELECTRON SPIN RESONANCE IN (TMTSF) 2PF6 IN THE HIGH PRESSURE METALLIC PHASE
L. J. Azevedo, J. E. Schirber, R. L. Greene, and E. M. Engler 1981 12 p refs Presented at the Intern. Conf. on Low Dimensional Conductors, Boulder, Colo., 10 Aug. 1981 Prepared in cooperation with IBM Corp., San Jose, Calif.
(Contract DE-AC04-76DP-00789)
(DE81-030233; SAND-81-1115C; CONF-810864-2) Avail: NTIS HC A02/MF A01

The electron spin resonance of (TMTSF) 2PF6 was observed at low fields (H0< 110 Oe) in the high pressure metallic phase (p > or = 6.5 kbar) in the temperature range 1 to 4K. The anisotropy in the g value is similar to that observed at ambient pressure above the metal insulator transition. Linewidth is very narrow and the spin susceptibility strongly decreases as the superconducting transition is approached from above. This is interpreted as evidence for single paired superconductivity. Superconductivity is observed at 1.1K and the critical field has angular dependence in the bc plane. These observations lead to the conclusions that (TMTSF) 2PF6 is a single paired superconductor.

OBSERVING SOLITONS IN ONE DIMENSIONAL MAGNETIC SYSTEMS
George Reiter 1981 10 p refs Presented at the Symp. on Neutron Scattering, Argonne, Ill., 11-12 Aug. 1981
(Contract DE-AC02-76CH-00016)
(DE81-029919; BNL-29957; CONF-810840-5) Avail: NTIS HC A02/MF A01

Classical models of one dimensional magnetic systems show that in addition to the linear spin wave excitations, there should exist localized, large amplitude excitations that can move along the chains while retaining their integrity. It is expected that these excitations, solitons, exist in real materials. The progress made to date in observing solitons in one dimensional magnets by means of neutron scattering, and the difficulties that still remain in unambiguously identifying the soliton contributions to S(q, omega) are discussed.

NEUTRAL DENSITY MEASUREMENTS IN DOUBLET 3
J. S. deGrassie, J. C. DeBoo, M. A. Mahdavi, N. Ohyabu, and M. Shimada (Japan Atomic Energy Research Inst.) Aug. 1981 16 p refs Presented at the Am. Vacuum Soc. Natl. Symp., Anaheim, Calif., 2-6 Nov. 1981
(Contracts DE-AT03-80SF-11512; DE-AT03-76ET-51011)
(DE82-000497; GA-A-16460; CONF-811113-14) Avail: NTIS HC A02/MF A01

In the Doublet III Tokamak a variety of cross sectionally shaped plasmas were investigated. Simple magnetically shielded ionization gauges monitoring the working gas pressure show a striking dependence upon plasma shape. Average neutral density varies over two orders of magnitude. In the extreme of the simplified poloidal divertor shapes the pressure exceeds 0.001 torr.

MACROMOLECULAR STRUCTURAL CHANGES IN BITUMINOUS COALS DURING EXTRACTION AND SOLUBILIZATION Annual Technical Progress Report, 1 Sep. 1980 - 31 Aug. 1981
N. A. Peppas, Mary Elizabeth Hill-Lievense, Donald T. Hooker, II, and Lucy M. Lucht 1981 236 p refs
(Contract DE-FG22-89PC-30222)
(DE82-000687; DOE/PC-30222/T1) Avail: NTIS HC A11/MF A01

Seven coal samples ranging from a lignite with 69.95% carbon to an anthracite with 94.17% carbon on a dry mineral matter-free (dmmf) basis were extracted with pyridine at its reflux temperature for two weeks. The coal matrices obtained were subjected to two degradation techniques, the Sternberg reductive alkylation technique and the Miyake alkylation technique. Gel permeation chromatographic analysis of pyridine-extracted liquids of the alkylated coal showed average molecular weights smaller than those of the original coal extracts. Electron impact mass spectrometry was used to obtain the mass spectra of these alkylated coal samples. Based on investigation of the recurring pattern of the peaks of the mass spectra of these products it was concluded that a cluster size of 126 to 130 is characteristic of the crosslinked structure of the coal studied. In addition, several chemical compounds in the range of m/e 78-191 were identified.

EVALUATION OF THREE PARTIALLY VOLATILE NEUTRON SHIELDS FOR HIGH-PERFORMANCE SHIPPING CASKS
H. J. Rack and H. S. Pearson (Applied Technical Services) Feb. 1981 41 p
(Contract DE-AC04-76DP-00789)
(DE82-000245; SAND-80-2303; TTC-0149) Avail: NTIS HC A03/MF A01

The thermal stability and mechanical behavior of three partially volatile candidate neutron shield materials were evaluated. The results indicate that silicone based rubbers, impregnated with elemental boron or boron carbide, Boro-silicone 236 and Bisco NS-I respectively are more thermally stable than are borated beechwoods, e.g., Permali JN. Mechanical property measurements indicated, however, that the compressive strength of the borated beechwood is 10 to 48 times higher than that of the silicone-based rubbers. The compressive strengths of the borated beechwood and boron carbide impregnated silicone rubber were substantially more sensitive to test temperature than was the compressive strength of the boron impregnated silicone rubber. The compressive strengths and energy absorbing capability of the boron impregnated silicone rubber is not affected by prior thermal exposure at 425 K for 1000h.

Monmouth) Sep. 1981 15 p refs Presented at the 4th Intern. Symp. on Neutron-Capture Gamma-Ray Spectry. and Related Topics, Grenoble, France, 7-11 Sep. 1981
(Contract W-7405-eng-48)
(DE81-030316; UCRL-85325; CONF-810920-14) Avail: NTIS HC A02/MF A01

From recent neutron capture gamma-ray measurements, experimental data for states involving quasiparticle-vibrational admixtures in Ra-227, Th-231, Th-233, U-235, U-237, and U-239 were compared with theoretical calculations by Soloviev's group. This analysis shows the experimental level structure is more complex than that calculated. In the levels of BK-250, four Gallagher-Moszkowski pairs are observed. The moment of inertia for each band with antiparallel alignment of odd-nucleon momenta is systematically larger than for its parallel-aligned mate. DOE

OPERATIONAL AND REGULATORY IMPACTS OF REGIONAL MANAGEMENT ON TRANSPORTATION OF COMMERCIAL LOW-LEVEL RADIOACTIVE WASTE

C. G. Shirley, E. L. Wilmot, and E. W. Shepherd Sep. 1981 36 p refs
(Contract DE-AC04-76DP-00789)
(DE82-000967; SAND-81-1509; TTC-0228) Avail: NTIS HC A03/MF A01

The current US low-level waste management situation and the conditions and requirements for management on a regional basis were examined. Using 1979 low-level waste volumes shipped to commercial burial grounds and six management regions, transportation requirements were estimated and compared for the two management scenarios in terms of cumulative shipping distance and transportation cost. Effects of these results on the demand for transportation services and equipment and on population risks were considered. Finally, current regulatory issues and the potential effects of regional management on regulation of low-level waste transportation were reviewed. DOE

DEVELOPMENT OF IN-CAN MELTING PROCESS AND EQUIPMENT, 1979 AND 1980

L. L. Petkus, D. E. Larson, W. J. Bjorklund, and L. K. Holton Sep. 1981 46 p refs
(Contract DE-AC06-76RL-01830)
(DE82-001050; PNL-3957) Avail: NTIS HC A03/MF A01

Nonradioactive process testing continued with the in-can melter as part of an investigation into the applicability of this vitrification process to various calcined high level and incinerator ash radioactive wastes. How waste composition and canister fins affect in-can melter capacity and how waste composition affects glass quality were examined. Process performance proved to be generally satisfactory. Pilot scale in-can melter runs were performed with synthetic, nonradioactive, high level wastes to produce eight canisters of glass. The synthetic waste processed included high level wastes as well as transuranic ash waste. Full scale in-can melter runs using nonradioactive materials were also conducted, producing ten canisters of glass. In the full scale in-can melter furnace the baffles separating the six heating zones were removed because of baffle warping. A remotely operated section connecting the spray calciner to the canister was tested. Some problems were encountered with calcine plugging. DOE

SPENT FUEL AND RADIOACTIVE WASTE INVENTORIES AND PROJECTIONS AS OF DECEMBER 31, 1980

Sep. 1981 293 p refs
(Contract W-7405-eng-26)
(DE82-000307; DOE/NE-0017) Avail: NTIS HC A13/MF A01

Current inventories and characteristics of commercial spent fuels and both commercial and US Department of Energy radioactive wastes were compiled, based on the most reliable information available from Government sources and the open literature, technical reports, and direct contacts. Future waste generation rates and characteristics of these materials to be accumulated over the remainder of this century are also presented, based on a present projection of US commercial nuclear power growth and expected defense-related and industrial and institutional activities. Materials considered are: spent fuel, high-level wastes, transuranic waste, low-level waste, remedial action waste, active uranium mill tailings, and airborne waste. For each category, current and projected inventories are given through the year 2000. The land usage requirements are given for storage/disposal of low-level and transuranic wastes, and for the present inventories of inactive uranium mill tailings. DOE

OPERATIONAL AND REGULATORY IMPACTS OF REGIONAL MANAGEMENT ON TRANSPORTATION OF COMMERCIAL LOW-LEVEL RADIOACTIVE WASTE

C. G. Shirley, E. L. Wilmot, and E. W. Shepherd 1981 4 p refs Presented at the ANS Winter Meeting, San Francisco, 29 Nov. - 4 Dec. 1981
(Contract DE-AC04-76DP-00789)
(DE81-025399; SAND-81-1509C; CONF-811113-3) Avail: NTIS HC A02/MF A01

A factor of two reduction in total shipping distance and cost is possible on a national scale if regional disposal sites are employed. Likewise, population risks and the demand for transportation services and equipment would be proportionally reduced because of shorter shipment distances and trip durations. The fate of regionalization of low level waste management and achievement of the cost and risk benefits that it implies is dependent on solving technical problems and resolving the institutional issues which result in multiple levels of regulations. COPPER-COATED LASER-FUSION TARGETS USING MOLECULAR-BEAM LEVITATION

Michael J. Rocke 8 Sep. 1981 14 p refs Presented at the Am. Vacuum Soc. Natl. Symp., Anaheim, Calif., 2-6 Nov. 1981
(Contract W-7405-eng-48)
(DE82-000644; UCRL-86114; CONF-811113-11) Avail: NTIS HC A02/MF A01

A series of diagnostic experiments at the Shiva laser fusion facility required targets of glass microspheres coated with 1.5 to 3.0 micrometers of copper. Previous batch coating efforts using vibration techniques gave poor results due to microsphere sticking and vacuum welding. Molecular Beam Levitation (MBL) represented a noncontact method to produce a sputtered copper coating on a single glass microsphere. The coating specifications that were achieved resulted in a copper layer up to 3 micrometers thick with the allowance of a maximum variation of 10 nm in surface finish and thickness. These techniques developed with the MBL may be applied to sputter coat many soft metals for fusion target applications. DOE

TAPE EXTENSOMETER SENSITIVITY AND RELIABILITY

J. L. Yow, Jr. and Dale G. Wilder 21 Sep. 1981 33 p refs Presented at the 24th Ann. Meeting of the Assoc. of Eng. Geol., Portland, Oregon, 27 Sep. - 2 Oct. 1981 Submitted for publication
(Contract W-7405-eng-48)
(DE82-000064; UCRL-86100; CONF-810972-1) Avail: NTIS HC A03/MF A01

A test of retrievable storage in granite of spent nuclear reactor fuel was conducted. The rock was instrumented to measure temperatures, stress changes, and displacements. Periodic tape extensometer readings provide test drift convergence data. Vertical and horizontal tape readings are made at five locations in each of two 11 ft x 11 ft drifts and six locations in a 15 ft x 20.5 ft drift. The sensitivity of the readings to temperature effects, errors in temperature corrections, change of steel tape, and change of operator was examined. Calculated corrections for temperature-induced changes in distance range from 0.0001 in. to 0.003 in./C. A tape changeout evidenced both a systematic error apparently due to slight changes in tape registration during punching and to nonidentical location of punched holes in the two tapes and a random error due to variability of reading and punching operations. These errors were corrected by making duplicate measurements for the tapes. DOE

DIAGNOSTIC DEVICE FOR BUNCHED ELECTRON BEAMS

J. C. Garrison and A. Szoke 19 Aug. 1981 20 p refs Presented at 1981 Workshop on Free Electron Lasers, Sun Valley, Idaho, 22 Jun. 1981
(Contract W-7405-eng-48)
(DE82-000639; UCRL-86617) Avail: NTIS HC A02/MF A01

It is noted that the operation of free electron lasers depends crucially on the bunching of the electron beam: it must be precisely modulated at the desired laser frequency, and it must occupy a narrow energy centered on a resonant electron energy. A method for measuring these properties directly by steering the e-beam through a properly designed wiggler magnet and observing the emitted radiation is proposed. This kind of device is closely related to the optical klystron, and it is expected that such devices will be important for understanding and improving the operation of free electron lasers, especially those with low gain. DOE

Investigations of the properties of the actinide elements in aqueous solution are continued. Analogous and complementary studies of lanthanide cations were conducted also. Potentiometry, calorimetry, solvent extraction, and nuclear magnetic resonance were the principle techniques. Evaluation of the thermodynamic values of complexation with series of alkyl dicarboxylate ligands provided understanding of the ring size for chelated complexes of these metals. Five and six membered chelate rings form but unless other geometrical features favor chelation, it does not seem to occur for ring sizes greater than seven. From a similar study of complexation with aromatic polycarboxylate ligands, transfer of negative charge through the pi system of the ligand enhanced the strength of complexation. Study of the PuO2(2)-bicarbonate system showed that two species formed in the solution. We assigned as these species PuO2(OH)

(HCO3)(+1) and PuO2(CO3)2(+2). In sea water, our results indicate that soluble Pu(VI) exists about equally as PuO2(OH)2 and PuO2 (OH)2(HCO3)(+1) with very little PuO2(CO3)2(+2). This reflects a substantial difference from U(VI), as the dominant form in sea water is UO2(CO3)(+2). A significant achievement was the automation of the titration calorimeter. This allows simpler, and more sensitive operation. Techniques for studying the redox behavior of Pu(VI) and Np(V) in the presence of organic complexing ligands were developed and initial studies begun.

DESIGN STUDY OF IMAGING TECHNIQUES FOR THE STARPROBE MISSION Final Report
M. Bottema 4 Sep. 1981 87 p refs Prepared for JPL
(Contracts NAS7-100; JPL-955929)
(NASA-CR-168392; JPL-9950-602; F81-08) Avail: NTIS HC A05/MF A01 CSCL 20F

A 10 cm aperture, off-axis aplanatic gregorian telescope is investigated as a candidate instrument for imaging from Starprobe in the 115 nm to 900 nm wavelength range. Focal lengths of 300 cm (f/30) and 150 cm (f/15) are compared in terms of optical performance, compatibility with the Starprobe spacecraft and response to the thermal environment in a 20-hour time interval, centered on perihelion. Ultraviolet/visible imaging from Starprobe concluded should be technically feasible. A 10 cm aperture telescope with focal length close to 300 cm is recommended for further study. This instrument should be capable of a detector-limited angular resoluton of about 2 arc sec. The estimated overall dimensions should not exceed 105 cm by 40 cm by 25 cm and its mass be less than 28 kg. The recommended concept assumes solid blank ULE mirrors, a graphite-epoxy optical bench, and an aluminum thermal enclosure, covered with multilayer insulation. These materials must be carefully selected to minimize the risk of UV photopolymerization of contaminants at the mirror surfaces during observtions.

TEST AND EVALUATION OF UV FIBER OPTICS FOR APPLICATION FOR AIRCRAFT FIRE DETECTOR SYSTEMS Final Report, 23 May 1980 - 23 Mar. 1981
Dayton, Ohio AFWAL Jun. 1981 58 p refs
(Contract F33615-80-C-2042; AF Proj. 3048)
(AD-A106129; AFWAL-TR-81-2049) Avail: NTIS HC A04/MF A01 CSCL 17/5

It was found that in the U.V. solar blind region, there are severe limitations on the field of view obtainable in Fiber Optic coupled systems. These restrictions are such as to make further consideration of the wide angle system concept unprofitable. This effectively limits the use of such systems in fire detection to applications where the precise location of a flame can be predicted. It is concluded that the performance of optical fibers in the U.V. solar blind wavelengths is such that the trade-off gains proposed in AFAPL-TR-78-84 cannot be realized in practice. Author (GRA)

TIME INTEGRATING OPTICAL SIGNAL PROCESSING Final Report, 1 Aug. 1980 - 31 Jul. 1981
Todd R. Bader, Peter Kellman, and Harry N. Shaver Jul. 1981 97 p refs
(Contract F49620-78-C-0102; AF Proj. 2305)
(AD-A106778; AFOSR-81-0700TR) Avail: NTIS HC A05/MF A01 CSCL 09/3

Optical signal processing architectures using time integration on the detector array provide a highly flexible, multipurpose, wideband, realtime processor. A key feature of the time integrating concept is the ability to perform very large time-bandwidth product processing operations on signals without having to store the entire time history of the signal as a spatial record. Further, these signal processing operations may be realized with either coherent or non-coherent optical systems. In the first phase of the program, a comprehensive treatment of time integrating acousto-optic signal processing was undertaken. This treatment includes a synthesis and evaluation of alternative architectures and a detailed statistical analysis of processor performance. New developments include the extension of one dimensional time integrating optical correlation to two dimensional processing, the concepts of interferometric signal processing techniques to complex computation. One and two dimensional complex signal processing algorithms have been developed for non-coherent optical realizations. Detailed analysis has been made for complex spectral analysis and ambiguity function processing. Complex computation using real correlation processing has been analyzed. GRA

EFFECTS OF STRONG TURBULENCE ON SHORT WAVELENGTH LASER: EXPERIMENTAL DETERMINATION OF MEAN SQUARE WANDER ANGLE Final Report
C. M. McIntyre 15 Sep. 1981 47 p refs
(AD-A106776; AFOSR-81-0726TR) Avail: NTIS HC A03/MF A01 CSCL 20/6

The objective of this experimental study was to verify analytical work concerning some effects of strong turbulence on short wavelength lasers. In particular, the r.m.s. wander angle of a transmitted laser beam, as a function of integrated path turbulence has been shown to increase to a maximum and then to decrease towards a constant value that is the same order as the diffraction limited spot size of the aperture in very strong turbulence. This means that an active correction for wander angle, applied at the transmitter, although useful at low to moderate levels of turbulence, is ineffective in increasing power density on the target for high levels of integrated path turbulence. An experimental measurement of the r.m.s. wander angle of a transmitted laser beam vs. integrated path turbulence in a simulated atmospheric path has been completed and the results are in qualitative agreement with the theory. The potential of reducing anisoplanatic errors in adaptive optical systems through the use of estimation theory is studied. Currently anisoplanatic errors place a fundamental limit on the performance of adaptive optical systems. Due to the ill behaved nature of the random processes involved, the estimation procedure is formulated in terms of the structure and hyperstructure functions. These functions are widely used in the literature dealing with turbulence and optical propagation through turbulence. A particular turbulence profile is chosen to evaluate the performance of the estimation procedure. A reasonable reduction in the anisoplanatic error is obtained through use of the estimation procedure. Only signals which are currently available in adaptive optical systems are required to implement the estimation procedure, no a priori knowledge is required. Author (GRA)

REAL-TIME IMPLEMENTATION OF NONLINEAR PROCESSING FUNCTIONS Final Technical Report, 15 Apr. 1977 - 14 Apr. 1981

Bernard H. Soffer Aug. 1981 61 p refs
(Contract F49620-77-C-0080; AF Proj. 2305)
(AD-A106773; AFOSR-81-0710TR) Avail: NTIS HC A04/MF A01 CSCL 20/6

Optical data processing has not achieved its potential of increased capacity and speed compared wth conventional electronic techniques primarily for lack of a practical real-time image modulator and because optical techniques have been almost exclusively limited to linear operations. The research outlined in this report of a four year research program attacks these issues by studying the implementation of real-time nonlinear parallel-processing techniques. The various implementations studied all employ real-time liquid-crystal light valves. These spatial light modulators were developed and specially modified for these tasks by Hughes Research Laboratories. One approach we have investigated was to modify and characterize the standard twisted-nematic liquid-crystal devices and then to use them in a coherent optical data-processing apparatus using halftone masks custom designed at the University of Southern California. With the halftone mask technique, we have demonstrated logarithmic nonlinear transformation, allowing us to separate multiplicative images and perform homomorphic filtering. In addition, a novel analog-to-digital converter, based on a modified purebirefringence liquid-crystal light valve, was developed and demonstrated. It can perform parallel processing using incoherent light, and it promises high data throughput rates. Furthermore, a novel device that converts local light variations to local liquid-crystal phase grating period variations has been fabricated and was evaluated and improved. GRA

FABRICATION OF HETEROJUNCTION LEDS FOR OPERATION AT 1.3 MICROMETERS Final Technical Report, 15 Jun. 1979 - 14 Jun. 1980

G. H. Olsen, F. Z. Hawrylo, D. J. Channin, D. Botez, and M. Ettenberg Sep. 1981 51 p refs
(Contract F19628-79-C-0115; AF Proj. 4600)
(AD-A107730; PRRL-80-CR-35; RADC-TR-81-199) Avail: NTIS HC A04/MF A01 CSCL 20/6

This report describes research undertaken to study and optimize the device properties of 1.3-micron InGaAsP edge-emitting LEDs fabricated by both vapor-phase epitaxy (VPE) and liquid-phase epitaxy (LPE). Edge-emitting LEDs have been prepared with both growth methods with a combination of properties rivaling the best reported to date. In the previous final report (RADC-TR-80-110) details of the VPE growth process were presented. Details of the LPE growth process are presented here. The LED efficiency of LPE devices was found to increase with decreasing cavity thickness. A value over 1% was measured with a 1000 lambda. Contact stripe width and coupling technique were also varied to achieve maximum power into an optical fiber. The best coupling was obtained with a 12-micron-wide contact stripe. Significantly better coupling was also achieved with a balled, rather than cleaved, end fiber. More than twice the power could be coupled into a 100-micron core diameter fiber, as compared to a 50-micron core fiber. The temperature dependence of LED emission was also measured for both VPE and LPE devices. LED efficiency dropped over 30% between 20 and 70 C, while an emission wavelength shift of 5 to 6 lambda/C was observed over the same temperature range. GRA

FABRICATION OF METAL MIRRORS FOR FAR-INFRARED WAVELENGTHS

Gerald F. Dionne 7 Oct. 1981 14 p refs
(Contract F19628-80-C-0002)
(AD-A107898; TR-588; ESD-TR-81-282) Avail: NTIS HC A02/MF A01 CSCL 20/6

A simple machining procedure has been applied successfully to produce metal mirrors suitable for far-infrared wavelengths. Ninety-degree off-axis paraboloidal or ellipsoidal mirror sections may be cut from brass or aluminum by means of a series of pre-determined increments on a conventional laboratory lathe. Paraboloidal mirrors with low f-numbers (f/2) have been used with good results as part of the collecting optics of a far-infrared heterodyne receiver. Author (GRA)

MODELS OF WEATHER ENVIRONMENTS ADVERSE TO ELECTRO-OPTICAL SYSTEMS

Wayne D. Mount and B. Richard Fow White Sands Missile Range, N. Mex. Army Electronics Research and Development Command Sep. 1981 111 p refs
(Contract DAAD07-80-C-0047; DA Proj. 1L1-61102-B5-3A)
(AD-A107637; ERADCOM/ASL-CR-81-0047-1) Avail: NTIS HC A06/MF A01 CSCL 20/6

Weather models were developed to depict hour by hour variations of scattering media, the atmosphere, important to Army electro-optical system performance. Dynamic models are presented for specifying particle size distributions in horizontal and vertical directions for haze, fog, cloud, and rain conditions given only routinely available meteorological data. Case studies show that these models perform well individually and when used together. This effort should be viewed as the first step in developing dynamic models that are responsive to observed and forecast weather changes. The models needed to be applied, tested, modified, and improved. Author (GRA)

ANGULAR INTERFEROMETRY-RESOLUTION ENHANCEMENT USING HALF-WAVE PLATES M.S. Thesis - MIT

George B. Hept Feb. 1981 49 p refs
(AD-A107974; AFIT-CI-81-59T) Avail: NTIS HC A03/MF A01 CSCL 14/2

Draper Laboratory is using an interferometer to monitor the rotation of an actively-controlled test platform to .01 arcsec. The resolution of the interferometer needed to be doubled in order to achieve this accuracy goal. The resolution of an interferometer can be doubled by sending the beam back to its target a second time. A method for doing this, analogous to the quarter-wave plate/plane-mirror doubling scheme commonly used in linear interferometry, was designed to double the resolution of the angular interferometer. This method used a combination of half-wave plates and retroreflectors to produce the doubling effect. Some simple, small-scale tests proved that this alternate method worked and that the use of the plates caused no discernible error. A full-scale test on Draper Laboratory test platform showed that doubling the angular resolution was practical and that .01 arcsec accuracy could be achieved. Author (GRA)

PROGRESS AND PROSPECTS AT THE NATIONAL

SYNCHROTRON LIGHT SOURCE (NSLS)
Malcolm R. Howells Jul. 1981 20 p refs Presented at the 2nd Natl. Conf. on Synchrotron Radiation Instrumentation, Ithaca, N.Y., 15-17 Jul. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030738; BNL-29985; CONF-810750-6) Avail: NTIS HC A02/MF A01

The National Synchrotron Light Source (NSLS) project is discussed from inception until the present. The commencement and motivation for the program are considered from the viewpoint of the needs of various experiments and the concepts of the Basic Source is introduced. The Basic Source has high brightness and tunability within the ranges 0 to 0.3 keV and 3 to 20 keV. The inclusion of tunability implies the use of monochromators and the role of these is discussed. The Basic Source is important because it satisfies a very large proportion of users. The strategy of NSLS in providing a good Basic Source and special devices (monochromators and wigglers) to allow coverage of the energy ranges outside those of the Basic Source is described. The NSLS facility will be completed within 2 to 3 months of its scheduled timescale and within its budget. DOE

The physics of gas breakdown for large collision frequency, nu/omega > 1, is being pursued at the Naval Research Laboratory. The hybrid inverted coaxial magnetron, 500 MW, 3.2 Ghz, 30 ns pulse width, allows investigation of gas breakdown in the high nu/omega regime. The 35 Ghz gyrotron, 150 KW, 300 pps, allows investigation in a moderate nu/omega regime. Large gas breakdown plasma densities have been measured, n approx. 100 n sub c. Spectral measurements have been made showing only excitation of molecular bands. Preliminary propagation experiments have also been performed. Author (GRA)

(AF Proj. 1209)
(AD-A106679; AFWL-TR-79-179) Avail: NTIS HC A03/MF A01 CSCL 20/9

This report explores the system aspects of driving implosion loads with inductive sources. High-speed plasma implosions represent an attractive approach to the production of an intense radiation source for use in an X-ray Effects Simulator. The nature of the implosion and the energy levels required for an X-ray Simulator make the use of inductive energy sources for driving the implosion attractive from the standpoints of both physics and economics. Parametric analysis and circuit calculations are employed to investigate the interrelation of circuit parameters (storage and load inductances), load parameters (mass, size, and speed), and switch parameters (resistance and rise time). The results show that 25 percent inductive to kinetic efficiency is attainable with only moderate requirements placed upon the switch performance. The status of current opening switch development is reviewed, and meets the minimum requirements predicted by the analysis. Author (GRA)

TILT AND SHIFT MODE STABILITY WITH LINE TYING Interim Report
J. M. Finn (Maryland Univ., College Park) and A. Reiman 23 Oct. 1981 57 p refs Sponsored in part by DOE
(AD-A106228; NRL-MR-4610) Avail: NTIS HC A04/MF A01 CSCL 20/9

Magnetohydrodynamic stability of force free spheromak plasmas to n = 1 free boundary tilt and radial shift modes is studied. The exterior region of open field lines is treated either as a conducting plasma or as a vacuum. In the former case the effect of line tying of the open field lines is present and is found to improve stability greatly. The equilibria which have optimum stability properties to the tilt and shift modes have a length to diameter ratio of 0.6, and can be stable with conducting walls at a relatively large distance. (Contract DE-AT03-76ET-51011; GEN. ATOMIC PROJ. 3344)
(DE81-030399; GA-A-16445; CONF-810745-2) Avail: NTIS HC A02/MF A01

The expanded boundary divertor configuration establishes a divertor plasma characterized by high density and low temperature and produces hydrogen pressures below the divertor region up to 0.001 Torr. The divertor density was found to rise nonlinearly with the main plasma density anti n/sub e/, scaling approximately as anti n/sub e/3. This behavior is described by a simple one dimensional parallel heat flow model that neglects radiation and particle transport except near the target plate (wall). The model further predicts that the divertor temperature scales as anti n/sub e/sub 2. DOE

COMPACT COMMERCIAL TOKAMAK REACTOR (CCTR): A CONCEPT FOR A 500-MWe COMMERCIAL-TOKAMAK FUSION SYSTEM
Thomas J. Gillen (Pennsylvania State Univ., University Park) Nov. 1980 70 p refs
(Contract DE-AC02-77ET-51010)
(DE81-030406; WFPS-TME-81-015) Avail: NTIS HC A04/MF A01

A detailed set of self-consistent parameters and cost for the conceptual design of a compact commercial Tokamak reactor (CCTR) is given. Several of the basic design features include an ignited plasma with a major radius of 4.9 m and a minor radius of 1.4 m; a net electrical output of 500 MW; a borated-water-cooled, stainless steel shield; and a toroidal field of 12 T at the coil. The design which utilizes a computer code for the costing and sizing of D-T burning Tokamaks mainly provides the sizes and geometries associated with the definition of the main component features for which a detailed engineering design can be effectively undertaken. Design study alternatives, including a neutral beam driven design, option, a design option with a toroidal field of 13 T at the coil, and a tungsten-shielded option are considered for the CCTR. Also included is the conceptual design of a computer fusion engineering device. DOE

HIGH-BETA STUDIES WITH BEAM-HEATED, NON-CIRCULAR PLASMAS IN ISX-B

E. A. Lazarus, S. C. Bates, C. E. Bush, B. A. Carreras, J. L. Dunlap, G. R. Dyer, P. H. Edmonds, J. H. Harris, H. C. Howe, and D. Hutchinson 1981 5 p refs Presented at the 10th European Conf. on Controlled Fusion and Plasma Phys., Moscow, 14 Sep. 1981
(Contract W-7405-eng-26)
(DE81-032003; CONF-810906-10) Avail: NTIS HC A02/MF A01

Some preliminary results of high beta studies on ISX-B for mildly D shaped discharges are described. This modest size Tokamak is equipped with two tangentially aligned neutral beam injectors giving a total power up to 3 MW. The poloidal coil system allows choice of plasma boundary shapes from circular to elongated (kappa = or approximately 1.8), with D, elliptical, or inverse D cross sections. The noncircular work discussed here is for kappa = approximately 1.5. DOE

N82-16875# California Univ., Livermore. Lawrence Livermore Lab.

DESIGN OF FIRST WALLS AND BEAM DUMPS FOR TANDEM MIRROR EXPERIMENT UPGRADE

R. P. Drake, D. D. Lang, A. L. Hunt, W. L. Pickles, T. C. Simonen, T. P. Stack, K. L. Wilson, M. I. Baskes, L. G. Haggmark, and M. E. Malinowski 15 Sep. 1981 16 p refs Presented at the 28th Natl. Symp. of the Am. Vacuum Soc., Anaheim, Calif., 2-6 Nov. 1981 Submitted for publication
(Contract W-7405-eng-48)
(DE81-030888; UCRL-86195; CONF-811113-7) Avail: NTIS HC A02/MF A01

Neutral reflux from the first walls and beam dumps of the Tandem Mirror Experiment (TMX) Upgrade could erode the neutral-beam-fueled, end-cell plasma or cool the neutral-beam-heated, central-cell plasma. To allow the TMX Upgrade to meet its design parameters, the neutral reflux to the plasma must be much less than the fluxes of both charge-exchange neutral products to the first walls and transmitted neutral-beam atoms to the beam dumps. To achieve this, the intent is to evaporate titanium as a getter on the first wall and install vanadium-foil beam dumps. The vanadium beam dumps will be heated by the neutral beam during the shot, releasing most of the implanted hydrogen as they cool radiatively after the shot. The deposited titanium will be thick enough to retain the implanted charge-exchange neutral products. The design of these components, estimates of their performance, and comparisons of their performance to the needs of TMX Upgrade are described. DOE

N82-16876# California Univ., Livermore. Lawrence Livermore Lab.

NEUTRAL-BEAM SYSTEMS FOR MAGNETIC-FUSION REACTORS

Joel H. Fink (Westinghouse Electric Corp., Pittsburgh) 10 Aug. 1981 23 p refs Presented at the Am. Vacuum Soc. Natl. Symp., Anaheim, Calif., 3-6 Nov. 1981 Submitted for publication
(Contract W-7405-eng-48)
(DE81-027940; UCRL-86196; CONF-811113-1) Avail: NTIS HC A02/MF A01

Neutral beams for magnetic fusion reactors are investigated. To optimize their performance to establish specific goals for component development, systematic analysis of the beamlines is essential. Three ion source characteristics are discussed: arc-cathode life, gas efficiency, and beam divergence, and their significance in a high-energy neutral beam system is evaluated. DOE

MULTI-SPECIES AMBIPOLAR PHENOMENA IN THE ELMO BUMPY TORUS

G. E. Guest *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 23-36 refs (For primary document see N82-16877 07-75)
Avail: NTIS HC A20/MF A01

An earlier, heuristic version of neoclassical transport theory suggested a plausible interpretation of empirical results from ELMO Bumpy Torus-I (EBT-I), such as the relation between electron temperature and density, the ambipolar electric field, and the distribution of ion energies in a two-species plasma consisting of equal concentrations of electrons and protons. This picture is easily generalized to include more than one species of ions, a situation which may arise experimentally by virtue of impurities or deliberate admixture of gases. The limiting case of a small relative concentration of a second species of ions is discussed and illustrated with plasma parameters typical of EBT-I/S. The dominant transport process for the trace ion group is assumed to be the rapid drift surface diffusion that results if the ion energy approaches the transitional energy, at which the net azimuthal drift velocity vanishes, W sub t approximately = qE sub r R sub c. Autor

EXPERIMENTAL MEASUREMENT OF PLASMA SPACE POTENTIAL

R. L. Hickok *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 37-62 Sponsored by DOE (For primary document see N82-16877 07-75)
Avail: NTIS HC A20/MF A01

The use of heavy ion beam probes to measure the potential in the central cell of the Tandem Mirror Experiment (TMX) and the ELMO Bumpy Torus - I/S is described. Sources of error are described and the need for careful calibration stressed. The basic operation of the heavy ion beam probe is described. The determination of space resolution, secondary ion energy measurement, time resolution, sensitivity and maximization of the signal to noise ratio, uncertainties in beam trajectories, three dimensional effects and the need for careful alignment of the complete beam system, and perturbation of the plasma caused by beam probing are discussed. J.D.H.

AMBIPOLAR POTENTIAL FORMATION IN TMX

D. L. Correll, S. L. Allen, T. A. Casper, J. F. Clauser, P. Coakley (Iowa Univ., Iowa City), F. H. Coensgen, W. Condit, W. C. Cummins, J. C. Davis, R. P. Drake et al *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 63-83 refs Prepared in cooperation with Rensselaer Polytechnic Inst. and Johns Hopkins Univ., Baltimore, Md. (For primary document see N82-16877 07-75)
(Contract W-7405-eng-48)
Avail: NTIS HC A20/MF A01

Experimental data from the Tandem Mirror Experiment (TMX) on ambipolar potential control and on the accompanying electrostatic confinement are reported. Results on the radial dependence of the central cell confining potential are given. Radial and axial particle losses as well as scaling of the central cell axial confinement are discussed. Author

SPACE POTENTIAL MEASUREMENTS IN THE CENTRAL CELL OF TMX

G. A. Hallock, R. L. Hickok, R. S. Hornady (Lawrence Livermore National Lab.), W. C. Jennings, and K. Saadatmand *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 85-103 refs (For primary document see N82-16877 07-75)
(Contract W-7405-eng-48)

Avail: NTIS HC A20/MF A01

A heavy ion beam probe has provided detailed spatial and temporal measurements of the Tandem Mirror Experiment (TMX) central cell space potential (phi sub e). With gas box fueling of the plasma at typical feed rates (radius of the limiter = 38 cm), the potential is strongly parabolic to at least 25 cm with phi = phi sub mzx (1 - r/32 cm) sq providing a good fit and 300 < phi sub max < 450 volts depending on machine conditions such as neutral beam heating current. With puffer fueling the central cell potential remains relatively flat to at least 30 cm.

POTENTIAL MEASUREMENTS IN PHAEDRUS - WISCONSIN'S TANDEM MIRROR

Robert A. Breun, Steve Golovato, Brian McVey, Art Molvik, Donna Smatlak, and Larry Yujiri *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 105-122 Prepared in cooperation with Lawrence Livermore National Lab. (For primary document see N82-16877 07-75)
Avail: NTIS HC A20/MF A01

First, axial, and radial potential measurements made on an afterglow plasma generated by on axis stream guns, plug ion cyclotron resonance heating (ICRH), and central cell gas puffing in the Phaedrus tandem mirror are described. For this mode, the radio frequency (RF) and stream guns are turned off at the same time. Initial potential and plasma parameter measurements on the RF sustained operation mode are illustrated. Here, the ICRH in the plugs is left on after gun turn-off and the plug density and diamagnetism are sustained for up to [illegible] ms (e - folding time). A near tandem mirror configuration is maintained without neutral beams. A computer plot of the magnetic field coil setting and the on axis magnetic field strength is presented. Plasma parameters are listed.

SPACE POTENTIAL MEASUREMENTS ON EBT

K. A. Connor, L. Solensten, F. M. Bieniosek, and R. L. Hickok *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 125-154 refs (For primary document see N82-16877 07-75)
(Contract W-7405-eng-48)
Avail: NTIS HC A20/MF A01

Heavy ion beam probe measurements of the ambipolar potential in the midplane of a single mirror section of the ELMO bumpy torus are analyzed. Measurements were made under all standard operating modes possible. The basic structure of the measured potential is presented. Particular emphasis is placed on the most pronounced features of the profiles and how they relate to operating conditions.

POTENTIAL FORMATION IN NAGOYA BUMPY TORUS

H. Iguchi, F. M. Bieniosek (Rensselaer Polytechnic Inst.), and K. Takasugi *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 155-166 refs (For primary document see N82-16877 07-75)
Avail: NTIS HC A20/MF A01

Space potential profiles in the Nagoya Bumpy Torus were measured with a heavy ion beam probe. Potassium and rubidium ion beams over an energy range of 3 - 15 kV were used to measure the potential with a spatial resolution of about 1 cm. Experiments performed at several different magnetic fields, especially at 1.8 kG (SR mode) and 3.2 (FR mode) are described. Measurements in typical T mode operation show a positive potential in the core plasma of about 200 V in both SR and FR modes. Varying the field correction loop current changes the core potential by + or - 50 V but the potential remains positive. The difference between the space potential and the floating potential measured by a Langmuir probe is 100 - 150 V, which is a few times the electron temperature of the core plasma. The effect on space potential of additional heating at 10.5 GHz was also investigated. Measurements of the plasma potential in the M mode show that the potential oscillates on a time-scale of 6 - 10 msec over a range of several kilvolts and these oscillations are correlated with oscillations in < n sub e 1 >.

ALUMINUM IMPURITY IONS AND THE AMBIPOLAR POTENTIAL IN EBT

R. K. Richards and E. F. Jaeger *In* ORNL Ambipolar Potential Formation and Control in Bumpy Tori and Mirrors Sep. 1981 p 167-182 ref (For primary document see N82-16877 07-75)
(Contract W-7405-eng-26)
Avail: NTIS HC A20/MF A01

Experimental evidence of a correlation between the electric potential and aluminum impurities in the ELMO bumpy torus (EBT) was investigated. This correlation is observed in the relation between the temperature of the highest aluminum charge state and the potential well depth. The aluminum temperature is determined for each charge state by measuring the Doppler broadening of a characteristic spectral line. Temperature as large as 650 eV have been found for Al(+3). Aluminum densities are derived by measuring the brightness of spectral lines with an absolutely calibrated spectrometer. The particle confinement time for the aluminum ions is determined by comparing the ratios of aluminum ion densities. Values for the aluminum confinement times are smaller than the electron confinement time by several orders of magnitude. Short lifetime suggests a large particle flux of aluminum and the formation of an ambipolar potential as a consequence.
